Yes -- I misunderstood. Apologies to anyone offended. I had assumed that
people wanted the X server so they could connect to some other machine
running the client. This would indeed be a useful product.

However, I'd be interested in seeing X client and server stuff compiled on
the ST under MultiTOS -- I have so little stuff that actually works under
MultiTOS (that's not a dig at you Eric -- it's a dig at the writers of
non-standard applications)

4656. HELP! In desperate need of a HD Controller

Newsgroup: comp.sys.atari.st
Date: 1992-10-27 11:18:50 UTC
From: kisaacso@nyx.cs.du.edu
Message-ID: <1992Oct27.111850.16329@mnemosyne.cs.du.edu>
Source record: 215699
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.wanted,comp.sys.ibm.pc

Ok, mistakes were made. While putting my HD into a case and other
modifications I managed to hook the power up backwards to the controller
card. I won't say that smoke came out, but it was hot to the touch.
Anyway, I now desperately need a new controller card. If anybody has
an Adaptec SCSI to RLL controller card you could part with, let me know.
I've got 50meg just wasting away until I can replace it.

OK, the problem was Flashdisk, the reset proof ram disk, elvis hates it
too. I suggest avoiding this program. A good reset proof ramdisk is ramplus
It works with MiNT, elvis and you can even safely un-MSA from it!

Greg.

Hello,

I remember hearing rumours a month or two ago, of a product called
GEMULATOR which was a ST emulator for PCs.

Does such a product exist?

And if so, can someone please email me some details?

Thanks in advance,

Alan.

I recently bought a Frontier Xtra-Ram self fit upgrade to take
my 512 STfm to 1 Meg. The PCB with the ram chips on it fits
on top of the shielding and has two sets of 8 chips on it, either
side of the main connector. (About 9 inches in length.)
Now I want to go to 2.5M. Do I need to buy these 8/9 SIMMS?
(Is that what I need?) And do I just swap the chips over?

Thanks in advance.

I'm trying to write a harddisk backup program for myself, and i could do with the source code to some sort of compactor program. i've heard you can get lharc as a library on the amiga - I could do with the source though.

Does anyone know where I could find one?

Thanks

David

>Of particular interest are changes in operating procedures and system
>configuration information.

You can use TOS 1.04 pretty much the same as previous versions.
The differences between TOS 1.04 and previous TOSes are mostly of
internal nature, i.e. The ways TOS does things have changed, but
the things it does are mostly the same.

>Is the keyboard reset a cold or warm reboot, or
>can both be done?

You can do both. If you press Control-Alt-Delete, you do a
warmboot, if you press the right shift key additionally, you do a
coldboot.

>Will existing DESKTOP.INF files be fully compatible, or do
>they need to be rebuilt?

I think the DESKTOP.INF files will be compatible. At least, I
just kept the files I had leftover from the TOS 1.02 times.

>Which operating system bugs (40-folder limit,
>install application, RTS/CTS, etc.) were _really_ corrected in 1.04 and which
>ones remain? What AUTO folder patch programs have been released to correct
>the remaining bugs?

There is a TOS14FIX.PRG for the AUTO folder floating around, I
think it's at a.a. I don't know what it exactly does, though.
Another thing is the POOLFIX.PRG, which removes some weird bug
in the management of the GEMDOS memory pool. Supposedly, this
weird bug has been introduced in the process of removing the 40
folder problem.

One problem is that Martin doesn't have more than 1meg. I've offered to do a version for 2.5 meg and he's sort of said yes, but I'll have to wait until I see him in a few weeks so I can borrow his sampler. As for the keyboard remaps, I'll certainly consider it. The reason for keeping the qweadzxc keymaps was to be faithful to the original... taht's the one we were used to and we didn't want to learn a different set of bindings ;-)

Problem (1) I don;t have a hard disk, so it'll take apprx 3 mins to load from floppy. There should be no problem just loading from a hd. though.

4666. Hermes UUCP Installation -- Help...!

Newsgroup: comp.sys.atari.st
Date: 1992-10-27 14:47:17 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <iL6aTB1w165w@ersys.edmonton.ab.ca>
Source record: 215617

Hello,

This morning I downloaded Hermes UUCP from a BBS in Canada and now I am trying to install it. For a little while, it looked as if things would go well.

I created the directories mentioned in the INSTALL.TXT file, and moved all of the .TTP and .PRG files to the E:\BIN\ directory. I moved all of the .1 files to the E:\USR\MAN\MAN1\ directory. Then I moved the CONFIG.SYS, ENVINIT, MAILMODE, MODEM.INF, MYDOMAIN, PASSWD, XHOSTS, and ENVINIT files into the E:\ETC\ directory. So far so good. I then moved HUSH.TTP to the E:\USR\BIN\ directory, and put DOQUEUE.HSH in the E:\ETC\ directory.

Now that I had everything where I thought it should be, I started editing the files. First, I did CONFIG.SYS. Here it is:

```
# everything after a hashmark is a comment
"0002" "elfhaven" # SITENAME
"0003" "Electric Storm" # ORGA
"0004" ".ersys.edmonton.ab.ca" # DOMAIN
"0005" "E:\usr\adm" # LOGDIR
"0006" "postmaster" # POSTMASTER
# "0009" "E:\etc\passwd" # PASSWD - this line is redundant
"9999" "1" # REDIAL
"0012" "E:\usr\lib\news\active" # ACTIVE
"0013" "E:\usr\lib\news\sys" # SYSFILE
"0014" "e:\usr\spool\mqueue" # MAILQ
# don't use line #15 unless you need HOSTS for non-HERMES software ...
"0017" "ersys" # RELAY
"0018" "E:\usr\spool\news" # NEWSDIR
"0019" "E:\etc\mydomain" # DOMAINFILE
"0020" "E:\bin\gnome.ttp" # EDITOR
"0021" "E:\tmp" # TEMP
"0022" "E:\usr\lib\mail\paths" # PATHSFILE
"0027" "server" # SERVER
"0028" "E:\usr\public" # SERVDIR
"0102" "F:\usr\lib\mail\alias" # STDALIAS
# "0103" "E:\etc\xhosts" # XHOSTS - this line is redundant
"0107" "E:\usr\bin\hush.ttp e:\etc\doqueue.hsh" # DOQUEUE
"0108" "E:\bin;e:\usr\bin;c:\bin" # PATH
"0109" "E:\bin\login.ttp -a" # LOGIN
# "0110" "E:\etc\envinit" # ENVINIT - this line is redundant
"0111" "MDT" # TZ
"0112" "E:\usr\lib\mail\spaths" # SPATHS
"0113" "E:\usr\lib\mail\mdbs" # MDBS
"0114" "E:\usr\spool\uupublic" # UUCPPUBLIC
```

```
# "0115" "E:\etc\mailmode" # MAILMODE - this line is redundant
"0117" "E:\usr\man" # MANPATH
"0118" "E:\bin\login.ttp -abMIDI" # MIDILOGIN
```

I included this file so that people could tell me if I did something wrong in it. (Later this will become important.)

Then, I edited the MYDOMAIN file:

```
.ersys.edmonton.ab.ca
```

Next up, came PASSWD (the docs were in German for this one, so I am pretty sure I got something wrong here):

```
root::0:0:System Administration:e:/usr/users/root:hush
mforget::100:1:Michel Forget:e:/usr/users/mforget:hush
postmaster::101:1:Postmaster:e:/usr/users/postmstr:hush
server::200:2:File Server:e:/usr/users/server:hush
ersys:password_deleted:600:6:UUCP ersys:e:/usr/spool/uucp/ersys:uucico
```

This file was very confusing (mentioned already) so I am sure something is not quite right. I never got this far, though. (More on that in a moment!)

```
ersys|||19200/r|4546093%4523254%4541808|ogin: |elfhaven|word: |\
password_deleted|\
e:\usr\spool\uucp\ersys|0|0
# last attempt: never
# last success: never
```

Okay! These are the "key" files. The system I am trying to set up is not lavish. I would like to receive mail and a few newsgroups and I will not be serving other sites. Everything comes in and goes out from the same machine to the same machine. I did not edit the PATHS file, since I am completely in the dark about that. Anyway, moving on.

I thought I was ready to test it out. This has been set up for days on the other end (ersys). I executed HUSH.TTP and it gave me a CLI. This is where the problems REALLY started. I CD'd to E:\ETC\ and typed:

```
doqueue.hsh
```

I was immediately rewarded with something along the lines of:

```
can't find batch
can't find batchmai
```

I thought this could be a problem with the PATH variable but I had no luck trying to get HUSH to tell me what it thought the PATH variable was set to. So, since the only CLI I know how to use somewhat effectively is Mupfel, I executed MUPFEL.APP and edited the DOQUEUE.HSH file like so:

```
rsmtp
rmail
rnews
fileserv
```

rmail
batch ersys
batchmai ersys

I had hoped that this would work as a bare-bones setup. I hoped wrong, it seems. I moved to the root of E:\ which is where both Mupfel and the DOQUEUE.MUP file resided. I typed:

DOQUEUE

The first program (rsmtp) ran. As soon as it started, it spat out a bunch of lines that looked something like (not exact):

getconfi.c (340): CONFIG.SYS ; SITENAME missing.

It went on down the list for almost every field in the CONFIG.SYS file (which is why I included that file in this message) and then it bombed! I thinkit was two bombs, but it may have been three.

This process was repeated for each program in the batch file (or it would have if I had not pressed reset after the third program bombed out; there was no real point in going on after that).

Can anyone help me out? This is a really strange problem. What should I do to fix my problem? If it matters, the version of TOS is 1.4, the version of Hermes is 1.00B, the version of Gemini is 1.2, and I ran HUSH.TTP as an overlay. I think that about covers anything I can think of.

I just hope someone can help me out with this...

Regards,

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse ......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I will only sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it.

PRICE: REDUCED REDUCED REDUCED
$600.00 w/o Printer
$650.00 with Panasonic printer. Sorry, I don't remember the
model number. It is Epson compatible however. Hardly
used.

Yet again I have the need for the english docs. for a program! After successfully acquiring the crackart english docs (and being disappointed it doesn't describe the disk-crack picture feature) I would like to geta hold of the english docs for "ORCS" (a seemingly excellent resource construction kit). Many features are simple to figure out, but I am not familiar with the usage of some of the box-types etc.! It's fun customizing program .RSC files for yourself, but I would like to be able to create some of my own! If anyone knows the whereabouts of the english docs for ORCS I would appreciate a hint! Thanks in advance,

T.T.F.N.
JR.

`TRUE COLOR' means that for any pixel on your display you can pick such a color that the human eye cannot distinguish between that color and the one you wanted to display.

The consensus is that you need 24 bits to get a number of colors larger than the human eye can distinguish.

So, you need at least 24 bits per pixel on your display to be able to get true `True Color'.

:^) By your definition, the hi-res ST mode (640x400x2) is True Colour! Eg I can
:^) digitise a picture, choose the nearest colour (black or white), then
:^) can change each pixel directly. And there is no CLUT. :-)
:^)
:^) True Colour, to me, is meaningless marketing term.
:^)

ST Mono actually _does_ have a lookup table as far as I can tell. I think you can set the foreground and background to either of the colors in the palette--black or white. Black on black is useless, as is white on white. The programs that invert the screen should show that the bit value in memory is _not_ a representation of the color on screen. I.e., it goes through a (nearly trivial) lookup table.

When I got my hands on that falcon and ran ST mono mode on an SC1224 color monitor, guess what? I was able to select the foreground and background colors from a _much_ bigger palette, something like 260,000 colors. So it seems to me that the ST mono mode is _not_ true color by his definition.

Just to cast my vote, I agree with the 'no lookup table' definition of True Color.

Hmmm... that's interesting because in all the articles that I have read, it is referred to as 16.8 million, not 16.7. But a much more important question is:

WHO BLOODY WELL CARES???

The continued drivel about what is and what is not true-color is banal. All that matters is Company X state how many colors can be shown on screen at one time out of a palette of how many colors. I don't care WHAT you call it, as long as I know what it can do. Sheesh... give it a rest, guys.

Joke? It's no joke as Gemulator does exist... I have one in my 486-33 right now. Of course, some folks might consider it a "joke" (albeit an expensive one) if they thought they were getting a _completely_ functional ST on a card! It may come true someday but in it's current state it's hardly usable, IMHO.

Anybody want to make me an offer for a like-new Gemulator w/TOS 2.06? Please? :)

Here we go again with the debate on what true colour means. Funny how this stuff just keeps cycling round and round. Sam Tramiel has stated publicly (the transcripts of his talk are widely available) that to them (Atari), all they meant by "true colour" was "no colour lookup table". Furthermore, what true colour "really" means is irrelevant and undecidable, since it is not a precise engineering term but a bulls**t marketing term. The name at the very least is incredibly bad, in what sense is it "truer" than something else?

> As an aside, I have a gif picture (Lush.gif), which is a photo-realistic picture
> of lots of lush vegetation. It takes 253 colours out of my 256 on the Workstation.

This poster doesn't understand a different term, "photo-realistic":

photo-realistic != GIF

Photo-realism is also a fuzzy term but is more precise than "true colour". GIF images are limited to 256 colours, period. A photo-realistic picture is indistinguishable from a real photograph, which is not even close to possible with 256 colours max.

Speaking of the original 1meg version, I started to play with it
when so many people were complaining about the 82/11 format. It had
been awhile since I used that format myself since it slows down disk
reads and writes a lot.
But what I found is that it's definately runable from a ram disk (so
I assume a hard disk as well), and also that after ICEing it (PFXpack
didn't seeem to like it), it fit on a standard 80/10 disk with room to
spare. In fact, so much room, that the loader and doc and desktop.inf
fit on there too. It takes about 10-15seconds for ICE to decompress
it when running, but at least it fits on a format that most people can
use.
Would it be worthwile to have Chaos in this form? The compressed
game without the loader is about 735k.

The 2.5meg version sounds interesting.

4681. Help: ACC telling application to scroll its window

Newsgroup: comp.sys.atari.st
Date: 1992-10-27 18:19:10 UTC
From: kremser@igd.fhg.de
Message-ID: <1673@igd.fhg.de>
Source record: 215500

```
i've written an ACC that dumps top-window's contents to disk.
straightforward :
- wind_get( WF_TOP, ... ) --> window handle
- wind_get( WF_WORKXYWH, ... ) --> work area
(with calls to wind_update() and graf_mouse() before and after dumping)

THIS WORKS OK, BUT... What to do with scrollable windows ?
a) scroll by hand, paste the dumps together
after finding the correspondent lines.... 8(

b) tell the application to scroll the window 8)

After some try & error (=reboot) 8-( the scolling part seems to work.

evnt_multi( MU_MESAG|MU_TIMER ... )

- MU_MESG && ACC_open
- host = appl_find() (names of a few prospective applications)
- wind_get( WF_TOP, ... ) --> window handle
- in_progress = TRUE

- MU_TIMER && in_progress
- wind_get( WF_VSLIDER, &pos ) --> slider pos
- wind_get( WF_VSLSIZE, &width) --> slider width
- construct a WM_VSLID-message : pos += width
- appl_write( host, ... )
- in_progress = (pos<1000)

with a form_alert here&there to show what happens.
This *seems* to work (the window scrolls), *BUT*
after quitting the main application, GEM locks up
(no Ctrl-Alt-Del).

Any clues why this happens ???
(I suspected the old appl_find()-after-termination bug, but
the appl_write() using the suspicious id is not called here..)

Thanx,

Source record: 215638

The original meaning of true color was 5 bits each of R-G-B AND no look-up table. For most purposes this is still adequate, particulary if you are attempting to view the result on a TV. With the advent of better monitors it became possible to support 8 bit each R-G-B. HOWEVER these monitors are VERY EXPENSIVE. The typical monitor that you have attached to a PC will only be able to support 5 bits of any color, and yes if you draw a horizontal line of all the intensities of a color you will see 6 maybe 7 bits worth.

The video amplifiers for current PC monitors are not capable of transitioning fast enough. There are notable exceptions, the Zenith Flat Tension Mask (FTM) monitor is one. The monitors that I seen recently connected to systems that support 8 bits each of R-G-B cost in the $1000+ range for 15" monitors.

If 8 bits each R-G-B is your requirement then the Falcon will not be for you. If however your desired output device is a TV/VCR then 5 bits each R-G-B will more than suffice.

So the Falcon DOES and DOES NOT have TRUE color capabilities. It just depends on what your requirements are.

I saw for %25 more than an A500 the extra colors alone make it worth the price. Ignore the 68030, 56001, FPU socket...

On a TT with a color monitor, you can set the 2 ST-mono colors to anything in
the palette--I have mine a little blue--easier on my eyes. And they stay set
that way when running Spectre (ever seen a Mac with a orange/green screen--
looks pretty wierd!).

4687. Megamax Laser C and TOS 1.04 (Rainbow)

Newsgroup: comp.sys.atari.st
Date: 1992-10-27 20:06:16 UTC
From: gregk@cpd.Tandem.COM
Message-ID: <1992Oct27.200616.29784@tandem.com>
Source record: 215632

I just upgraded my system to TOS version 1.04 (also known as Rainbow TOS). When I started Megamax Laser C (v2.0), it reported that the configuration file needs to be updated using the PATCH program. I ran the PATCH program and it needs some numbers to be associated with each TOS version (the version I have doesn't have numbers for TOS 1.04).

These numbers are only distributed by Megamax, so I tried to ring them and the number is no longer valid.

Does anyone have the current telephone number for Megamax? Or, does anyone have the patch numbers for TOS version 1.04? (To display the numbers, run PATCH and select TOS version 1.04).

Many thanks, Greg.

4688. Help me with ST & hamm radio, please!

Sorry, this is a completely stupid statement. The number of pixels on
the screen is totally irrelevant here. It could be a 320x200 screen even.
The point of having a large number of colours available is so that you
can choose a pixel value as close to any possible real-world colour
as possible. IT IS NOT SO YOU CAN HAVE THEM ALL ON THE SCREEN AT ONCE!
True, 16 million is a bit high, but it is certainly sufficient, and
the hardware works out nicely with a byte per primary colour.

4691. pcditto .... colour only?

Newsgroup: comp.sys.atari.st
Date: 1992-10-27 21:29:23 UTC
From: Mike Stramba <stramba@zooid.guild.org>
Message-ID: <1992Oct27.212923.10460@zooid.guild.org>
Source record: 215646

Is anyone running PCDITTO 3.01 with a MONO monitor?

I get the copyright screen coming up on my mono, monitor, it asks for the dos disk, and then dies.

If I run it on a colour monitor (a t.v. actually) it does work.

Seems strange to me that the main screen will come up on a mono monitor but then not run.

How about 720k disks with PCDITTO 3.01?

Does it not support them?

I use the proper dos syntax and it gives me 'parameter not supported'.

Is this a dos message or coming from PCDitto (I'd vote for PCDitto).

This is indeed correct, as you can flip the colors in ST High mode. If
there were no CLUT, that would require you to go through the entire screen
memory and flip all the bits, which isn't done in the blink of an eye.
Look at the color CPX in monochrome and I believe it should let you
change the orientation.

>

This sounds just like the TT's emulation of ST High mode, called
"duochrome." This is still 640x400x2 colors, but you can pick the 2
colors out of the 4096 color palette, enabling you to do green-on-cyan
or something if you'd like... :)

>
>Just to cast my vote, I agree with the 'no lookup table' definition of
>True Color.

So do I, this sounds like a well-defined definition which avoids
confusion. This meaning that the value for each pixel _actually_ and
truly represents the color of that pixel, whereas in non-true color
mode, the value for a certain pixel, to an outsider, really has nothing
to do with the pixel's color at all (just some arbitrary placement in
the CLUT).

Yes, the 68020 was used in the Sun 3s. I believe that the 68010 may have
been used in Sun 2s, although I am not sure of this as we don't have
any of those around here.

>According to Dragon Magazine #185, SSI will no longer produce any AD&D games
>for the ST. I have no idea what quality the games were, but this can't be
>good.

Every SSI game I ever bought for the ST wasn't worth a darn. I
didn't buy the Phantasie series, but they looked like Ultima clones
with worse graphics. Their war games had the worst, bar none, user
interfaces I've ever seen. I bought Red Lightning, and it was
unplayable. Wizards Crown appearantly looked better on the 8 bit. SSI is
unfortuantely no loss to the ST world, except perhaps their Eye of the
Beholder series, which they bacicaly copied from Dungeon Master, even
more than Captive and Knightmare.
I for one have no sympathy for companies who release substandard
product and the whine when no one buys it.I guess in the DOS world, where
ever if .01% of the userbase gets suckersed into buying your product,
you've made money, you can get away with this.
Even Microprose, whose Railway Tycoon I bought abnd love, does
bad ports to the ST. Put any of their flight simulators up against Falcon,
and they pale by comparison. IMHO. However, I'll miss Microprose, especially
Civilisation, though if it was a straight port, the graphics would have been
terrible, at least Sid Meyer's games have playability.

>to the colour resolution of the human eye. The only problem I see is with
>grey-scale images, but two bits of brightness resolution should not make
>much difference at all.

For grey scale images, your two real choices are:

16 shades, using a 4-bit mode (0 wastage (all 4 bits used))
64 shades, using an 8-bit mode (25% wastage (6 bits used))

Obviously this is useless:

32 shades, using a True colour mode (69% wastage (5 bits of 16))

If you're REALLY into greyscale images, buy a TT and use the 256-shade
Grey mode. I doubt you'll see much difference: 64 shades is a LOT.
It's 8 TIMES the accuracy of the ST's 8 shades, and I've seen some
excellent 8-shade images. I really doubt anyone could tell the shades
apart, except on a contrived example (eg. a shade 40 square on a
shade 39 bachground).

Just use your Control Panel (or Colour CPX), then save the Uniterm
settings (under "File").

WARNING: If you have a monochrome monitor, be careful about saving colours,
because if you're not careful, you'll save it with all black colours (which
is still black-&-white in monocrhome), and have a HELL of a time getting
the colours back to normal if you switch over to colour!

MB> contol the cursor. Since all ST's have a keypad and most have a joystick
MB> handy, this would be a great improvement.
As to the numbers... The numbers are used for displaying, what things belong to
which wizard... The Joystick would be an idea, but if you only have an old
joystick, you might perhabs get problems with diagonal movements...

BUT concerning the German keyboard problem... A friend of mine write a small
program, that will patch the 1 Meg version of Chaos in all needed locations, so
that you can enter the Names with the normal German layout, but - during the
game, the y & z keys get exchanged... Very handy.... ;)

If MJ Bronlow has nothing to say against it, I'll upload the patch programm to
a.a and other ftp-sites...

bye,

Benedikt

I think the subject says it all. Can someone provide or direct to answers to
these questions:

* what reasonable machine requirements are
* what you need to have access to (modem types, host machines, etc.)
* basic outline of what is involved with uucp (the actual process)
* finally, what does one need to know to be able to set one up.

Ich glaube, daB es gluecklich ist, daB ich ein bischen Deutsch lesen kann!

I imagine that I'm not speaking for myself when I say that, due to the questions
I've been seeing lately, that the process seems very intimidating.

All I've been able to suss out is that I will need to read German, understand a
little about the Internet infrastructure, and have access to a machine which I
can send my data through. Otherwise, it seems about as clear as mud.

If I *ever* figure this out, I'll post a lucid summary (auf Deutsch :)

...
>If you pick up a book about computer graphics you will find that 32 is
>quite sufficient. There isn't much difference between 32 and 64 and almost
>no visible difference between 64 and 256.

On page 566 of _Computer Graphics Principles and Practice 2nd Ed_
by Foley et al, there is a table giving the required number of intensities
for various media. For CRTs, they list 400-530 intensities. There
are several B&W examples with varying numbers of intensities, and
in discussing them the authors state:

"This suggests that 64 intensity levels is the absolute minimum
needed for contour-free printing of continuous-tone black-and-white
images on paper... For a well-adjusted CRT in a perfectly black
room, however, the higher dynamic range means that many more levels
are demanded." [p567]

Note that when they state 400-530 intensities, they are referring
to equal-ratio (i.e. logarithmic) intensities, rather than the
typical linear scale (which would require even more levels).

Another point to keep in mind is that RGB color space does not
encompass all the colors that the eye can perceive.

>Besides why anyone would use the 32K/64K colour mode for grey scales is
>beyond me. If you limit yourself to a fraction of the palette anyway you
>might as well use a LUT-mode.
>

I don't think anyone is seriously advocating using a "true color"
mode to display gray scale pictures. The point is that if 24-bit
color can represent all perceivable colors (as some people contend)
then people should not be able to perceive more than 256 levels of
gray (which after all is a perfectly valid color).

4709. 520ST w/drive for SALE - $70 ********

Newsgroup: comp.sys.atari.st
Date: 1992-10-28 04:36:00 UTC
From: v115lue3@ubvmsb.cc.buffalo.edu
Message-ID: <BwtE43.JDF@acsu.buffalo.edu>
Source record: 215552

Having sold off the other extraneous systems I had, the above is still remaining. To restate:

520ST - 1/2 meg, RF modulator built-in
SS drive - external
mouse, power supplies & all cables (except a tv switchbox, one of which everyone has laying about anyway) included
10-15 blank disks

Total price = $70 + 1/2 shipping (figure $7.50)

All of the equipment is in virtually new condition, the computer itself may have never seen use, same goes for the drive. On the off chance you're tempted but not sure, I'll consider bids if I get them..

Source record: 215553

For Sale:

--> 1040 ST
Standard machine with 1 meg and double sided drive. Good cond. $125

--> Quick ST 3.1
I think that is the correct version. It is the most recent version
prior to Warp 9. $12.

--> Script
This is a nice, flexible, easy to use word processor. It includes graphics
capabilities, multiple fonts, built in spell-checker etc. $20.

--> DynaCADD
This is the most powerful CAD package available for Atari computers.
This is version 1.4, but it is registered, and can be upgraded to the
latest version (even the TT version) for $99. Last time I checked
mail order prices, this package still cost > $600. I'd like $175.

--> Astra Systems HD host adaptor
Old and possibly non-functional. I don't know much about it. But hey,
it's FREE to anybody who might have some use for it.

Prices don't include shipping. Please send me some mail if you are interested,
or if you have any questions, comments, ect. Thanks.

Doug Tarico

> yours,
> Benedikt
>

Just a little precision: the T800 (processor used in the ATW) doesn't have an MMU, so that virtual memory is not trivial to get (you need costly external hardware). Since the next transputer (called T9000) is not out yet, any current Helios version is unlikely to provide vitual memory !

So the question is always the same: how did they do ?
I think it's possible thanks to an old version of X (maybe X11R3 or even X11R2, who knows) or to a special rewritten X server !
(don't forget X worked on 68010 based stations)

Anyone has precisions ?

Stefan

> isn't one I will probably get flamed!)
>

Harvard architecture means just that data bus and instruction bus are
separated. This can be internally or(and) externally.
the 68030 had (and still has) an internal Harvard architecture (this holds
of course for the 040 and without a doubt for 060). The 88000 line
of RISC processors from Motorola has an internal and external Harvard
architecture.
Some other processors use a 'mix': the data part of both buses (data and
instructions) is separate but the address lines are shared (I believe it
is the case for the AMD29000, used in some graphics cards (from Apple,
for example) and some laser printers).

Note that on the other side, the 8086 used a common data and instruction
bus whose data and address lines were externally shared (that's why it's
a 40pin chip whereas the 68000 needs 64pins)

Anyway, the 040 is a 32bit processor (two 32bit buses != 64bit)

This may seem surprising but: get version 1.33 (HSC)
The reason of the different numbers is that these are two separately
developped compilers, both deriving from version 1.2 I believe.

The only problem I can see with 1.33 is the limitation on 7 chars
for external identifiers (you can use bigger identifiers, but only the 7
first chars will be taken into account)

This 1.33 is easy to install easy to use and quite stable !

Guess what - I have some problems with this. :)

In article <92298.104409EENG6826@RyeVm.Ryerson.Ca> <EENG6826@RyeVm.Ryerson.Ca> writes:
> Amiga 4000 Falcon
> ==========
>Processor 68040 @ 25MHz 68030 @ 16 Mhz
>Graphics 256000 @ 16Million 65536 @ 65536
(this is HAM mode - normal operation
is limited to 256 color palette)

>Sound 8-bit coprocessor DSP - No software

Ok, I realize that you don't consider the D2D that comes with the falcon
as software (or the other utilities), but all of the major midi software
companies have DSP-ware in development, some closer to production than others.
The point I am trying to make is that the DSP is a totally new device for the
Atari - if you give the developers a decent chance to write software, they will
(and are) do so. If the Amiga had a DSP on board, I am sure that there would
not be much out for it (right now) either. The "No software" is not relevant
and is only being used to make the Falcon look worse (than the entry-level
computer that it is, and not the high-end station it is being compared with -
the fact that it stands _any_ comparison is a compliment to its design).

>Co-Processors Lots Blitter
Technically, the DSP is also a Co-processor, as well as the video chips (which
I believe incorporate the Blitter). BTW, when you say "Lots", do you mean that
there are more co-processors than for just video,audio,and I/O? What are they
for?
>PD software About 3x the ST About 1/3 of Amiga

This is your opinion. I happen to disagree with you. This might be
an accurate ratio of BBS's, but I don't believe that it accurately reflects the
variety of software that is available out there.

>Graphics/Video Lots of software None ???
For this, it would depend on the type/quality of software you are looking to
compare. For video editing/studio work, the Amiga does have more professional
titles (I do not know the status of quality PD video software). For DTP, the
professional titles available for the Atari rival or surpass those for the
Amiga. If you are talking about PD image display/manipulation, I am sure that
both platforms have a plethora of relevent software.

>Midi Not much A lot
>Harddrive 120Mb 65Mb
>Memory 6Mb 4Mb
>Disk Drive 1.76Mb 1.44Mb (IBM compatible)

According to the Adds I have seen for the A4000, they have software that makes the Amiga floppy "IBM compatible" but that doesn't mean that it is limited to 1.44MB. As it so happens, the Atari floppy does write 1.76MB (or so) floppies. In fact, you can just plop in a 2.88MB floppy and it will work fine (or so the specs say, but since I haven't personally seen this yet, I can't verify this).

>Multitasking Yes (For the past 5 years) No (Maybe next year)

Built-in? Then yes, this is accurate. But MiNT has been available for years, and it has been a more than satisfactory multitasking environment for many people. Just as OS/2 gives multitasking to the IBM (but MiNT takes up MUCH less space :)
>MSRP CDN$4595 (No monitor) CDN$1499 (No monitor)
Just to put in US$: $3700 $1399

Now, just so you don't get the idea that I am being blinded to the deficiencies of the Falcon - think again. A4000 went the right way when they put in a completely removeable CPU design - the CPU is on a card, you just rip out and put the new 68060 when it comes out, or maybe just a 60MHz '040...whereas the Falcons CPU expansion is limited to a crippled (68k) PDS slot - rediculous that they would think they could save enough money doing this to ofset the fact that fewer people will buy it when they find they can't upgrade to a faster '030, or '040, or '060, or put that '386DX board in.
Luckily you will be able to get expandibility from the DSP and SCSI-II slots, but they won't help in the CPU area.

>My advice: Get a 486/50MHz, 16Mb RAM, 200Mb hard disk and OS/2 v2.1.
> Pro Audio 16, ATI ULTRA PLUS (16Million colors, 2MB RAM)
> CDN$3000 (No monitor)

Yuck. You forgot to add the %200 increase to software price, as well as the fact that you will have to often buy 2 or 3 software packages in order to run the one you want, or to run it half-way decently. This is IMHO as I personally consider a computer without access to a GUI to be usable, but hardly efficient. Putting Windows (NT) or OS/2 means that the IBM is usable. I do network support so I spend plenty of time in DOS, its just that I don't do it for the fun of it, and stay in Windows whenever possible. Oh yeah, don't forget that BIGGER is BETTER mentality that has made the average size of new software somewhere between 10-15MBs - it will eat small capacity drives for breakfast.

>Carlos Varela.

BTW, I haven't seen any of the software you put up on A.A. a few weeks back. Anyone know what happened to it? You know, the SPX viewer/pics, etx.

-Mike

In article <1992Oct27.201336.14134@ulrik.uio.no>, jarleb@medusa.uio.no (Jarle Brinchmann) says:
>
>Have you or anyone else any adresses or anything more ?
>What can it do and so on ?
>
RIEMANN started as a 'port' of the well-known muMATH-83, which
was available for CP/M and DOS. The first version of RIEMANN
was mostly compatible with muMATH programs, but added many features,
most notably numerical processing and elementary graphics. And, of
course, memory beyond 320 KBytes...
The next major release, RIEMANN 2, got a much improved user interface
and very powerful graphics functions. And in the course of time
the number of additional packages for various applications grew.

One of the handy (and to my knowledge unique) features is
'formula modelling', which is an easy way of specifying
changes to parts of a formula. Normally with computer-algebra
systems it is quite tedious for example to expand a cosine
somewhere inside a complicated expression without expanding
anything else. With Riemann, this is a trivial operation.

When compared to its main competitor, Maple 4.2, Riemann has a
much better user interface, much better graphics, and easier
programmability. The number of application packages is also much
higher. On the other hand, Maple is better at performing more
complicated operations like integration and summation.

I have both Riemann and Maple installed on my system, and use both
of them regularly.

RIEMANN has been written by Begemann & Niemayer in Karlsruhe.

It can do, whatever you want. I don't have the handbookt right now
here and I didn't work with it in the last three months, so I do
have to tell you all that by heart:

- lots of functions: besides the standart functions (sin, exp, ...),
functions for root findings, complex functions (PD-Lib),
functions for working with polynomials, etc, etc, etc ...

- you have the possibility to extract results, or to prevent it.
Well I mean, that you can tell it, that it shall work with, e.g.
sin(.5) as sin(.5) (accurat, but slower), or with sin(.5) as
.47942.... (less accurate, but quicker)

- lots more

Peter Loibl
pal@regent.e-technik.tu-muenchen.de

P.S. I hope, that I will post the adress of Begemann & Niemayer
tomorrow.

Steve writes:

-->All that True Colour means is that there is no colour lookup table. The
-->Sinclair QL had true colour, ok, so it was 4 bit true colour.. so what!

Sorry the origins of true color may have started out as you say, but now throughout the computer graphics world true color has come to mean 24Bit color ie 8bits RGB. The human eye can,t tell the difference between 256 shades of RED GREEN or BLUE so there is no point having more color than this.

-->I am getting sick to death of all this drivel about true colour being
-->something to do with the size of the display.. you'll be telling me next
-->that the human eye is a pseudo clour device cos it can resolve more pixels
-->than it can colours!

Yes your right again the screen size has nothing to do with true color, what I was saying was the hardware must be capable of displaying all the colors at one time. If the Falcon has 16 bit color then it is not true color in the true sense.

GARY.

When we speak of 'harvard architecture' and 'seperate buses', don't we
mean seperate busses for program code and data? So in fact there would be
two data busses, one for the instructions and one for the data.

Correct me, if I'm wrong ...

Well, first of all, I agree! The game is not worth it!

But:
Why is that a 'ridiculously large disk format'? Why is it so ridiculous to have
an extra 200 kByte on your DD-Disk?

There are a lot of people who do not own a HD-drive. So this is the best alternative
to gain more storage space - about 30 %!!!

I use the HYPERFORMAT, which it is called in Germany, all the time, except for data
transfer to MS-DOOF, since those machines cannot cope with any neat disk-format.

Hi folks!

Yesterday, I tried to compile a tcsh 6.00 out of Eric's sources with
the new -mbaserel option and appropriate libs. All went fine, but:

Each keystroke is printed twice in the command line, however the
command is executed correctly. Control characters are treated even worse.

I used the curses lib from the /atari/gnu distribution and compiled it
with -mbaserel. (BTW: The shared memory effect works very well!)
Can anybody help me what is wrong with it?

Thanxalot,
Markus.

People get confused if you use this definition: you would actually need 24
million pixels for that. Of course this is not what you mean. What one means
is that the hardware must be capable of giving each pixel any possible color
value out of 16 million.

4738. About Riemann

Newsgroup: comp.sys.atari.st
Date: 1992-10-28 15:52:06 UTC
From: ebeling@physik.uni-bremen.de
Message-ID: <ebeling.2@physik.uni-bremen.de>
Source record: 215588

Well,
I used Riemann for some time it is really not bad and can do nearly
all the stuff that Mathematica can do. It also supports TEX output
and color graphics. In connection with a Deskjet 500C it should be
able to do color prints, because it relies on GDOS for the output.
RIEMANN started a mu-math form the PC, I believe. But it was rewritten
completely. I can not tell you the address of the guys n Germany who
wrote it and distribute it. I'll look it up.
It is not a comfortable as Mathematica, but it does a really good job.
Only flaw, it has s german user interface....

Walter

[...]
> Mark
>

This topic came up earlier this year and was beat to death! I certainly
don't want to exhume it :-), so here's what I saw as the outcome.

"True Color", as a buzzword, has two valid definitions:

1. 16 million + colors (24 bits).

2. A color system in which the pixel data represents the "true color"
of the pixel rather than pointing to an entry in a color map (pseudo
color). GIF is a "pseudo color" system: The pixel data is an
8 bit value that points into a color table of 24 bit values.
The 16 million + colors are there, but you can only use 256 of
them per image. The ST is "pseudo color": pixel data points to a
color map value. The Falcon by this definition can display
"true color" meaning that the pixel data represents the actual
mix of red, green, and blue and NOT a color map indice.
This is implicit also to definition 1, since 24 bit systems don't
need to employ color maps (although they sometimes do have a LUT
for color correction, special effects, etc).

4741. Re: Hermes UUCP Installation -- Help...!

Newsgroup: comp.sys.atari.st
Date: 1992-10-28 17:12:22 UTC
From: knarf@nasim.sta.sub.org
Message-ID: <H.ea.tVYghHzrwkU@nasim.sta.sub.org>
Source record: 215358

Hya!

I think it's not a good idea to start with HERMES 1.00B. Try to get the newest version 1.04. As I remember the archive is packed with folders so you only have to edit the config-files. I've heard it's not as easy to upgrade from 1.00 to 1.03 than from 1.03 to 1.04. (I started using HERMES with 1.03).

If I want to call my (one and only) site, I always use the program 'uuwork'. It starts the doqueue.hsh if needed and calls the uucico (newest version: 3.43.2) by reading (and writing) the xhosts-file.

Here some help with the paths-file: My SITENAME is 'nasim', the site I call is 'stasys' and my DOMAIN is '.sta.sub.org'.

```
---------------paths-----------cut here-------
nasim %s
stasys stasys!%s
stasys.sta.sub.org stasys!%s
---------------paths-----------end of file----
```

You do not need the third line but I recommend to use it.

If you don't want to serve files, you do not need 'fileserv' and 'server' in your 'doqueue.hsh'.

Hope that helps. Ask if it does not!

>Any comment on how this will affect Falcon prices/sales?

It won't. Jim Allen on GEnie said that because Atari's RAM boards are
manufactured in Taiwan and sent over here as an assembly, they won't
be subject to the tariff. He also said that the only reason DRAM prices
of European and Japanese chips might increase is from people switching
over from Korean chips, but that the increase shouldn't be as significant
and would only be there to gouge uneducated buyers. He said he spoke to
his distributor who deals in Japanese chips and he reported no price
increase.

>for my eyes....So if anyone knows away please email...

I'll send an e-mail copy of this, but there are probably other readers of this forum to whom the answer might be of interest also...

To change the screen colors in Uniterm, you will need to have the Control Panel accessory (or the XCONTROL panel and it's associated CPXs) running at boot time.

OK, so you've got the Control Panel available as a desk accessory. Now, run UNITERM. Press the HELP key to get the help-page/menu-bar. Select the Control Panel from the Desk Accessory menu and change the foreground - background - text - whatever colors to your content. I personally have a deep blue background with yellowish letters set up. You actually only need to change the "white" and "black" colors to what you'd like them to be. After you've done all of this, go to the menu-bar and select the SAVE SETUP option from the FILE menu. Your color selections will be saved with the rest of the regular setup information (you know, buffer sizes, RS-232 parameters, etc).

The next time you run UNITERM - with or without the Control Panel - your screen will come up in the colors you previously selected. This is one of the many features which Simon Poole incorporated into Uniterm which weren't really necessary, but which make the program that much nicer to use.

> images on paper... For a well-adjusted CRT in a perfectly black
> room, however, the higher dynamic range means that many more levels
> are demanded." [p567]

This is absolutely correct. Since 64 intensity levels can be represented
with 6 bits of resolution, and provides contour-free PRINTING. A 256 shade,
8 bit gray-scale screen image should be indistinguishable from a B&W photograph,
assuming enough X-Y resolution. This can be extrapolated that you would require
8 bits of red, green, and blue information to reproduce a 256 shade gray-scale
image. So a colour system will require 24 bits of information to produce a
256 shade gray-scale picture, (R=B=G) regardless of where or not the 24 bits
resides in the frame buffer or in a look-up-table.

> I don't think anyone is seriously advocating using a "true color"
> mode to display gray scale pictures. The point is that if 24-bit
> color can represent all perceivable colors (as some people contend)
> then people should not be able to perceive more than 256 levels of
> gray (which after all is a perfectly valid color).

I think we agree here also. Extrapolating this to mean that you need
24 bits of information to produce TRUE colour is not accurate. This
assumes that everyone can see 256 shades of Red, 256 shades of Green, and
256 shades of blue produced on a CRT.

Becasue the eye has a very hard time distinguishing shades of blue early
eight bit colour system used 3 bits for red and green and two bits for blue.
The first 64K colour system I worked with had 7 bits for green, 5 bits for
red and 4 bits for blue. The number of bits for each colour was determined
by the eyes ability to perceive that colour.

>Does anyone know if the the new Falcon will have OS level support for
>the Photo CD System?

Hmmm. well, I sell Photo-CD, and the information that I have
received from the manufacturer does not mention "OS support" in
Macintoshes.

Here is the poop about computer accessability with Photo-CDs.
Phot-CDs can be read in CD-ROM XA readers with "approrpiate
extensions". I read it as if you have a CD-ROM XA with the
appropriate software to read the disk, then you can view Photo-CDs.
Now manipulating the images is something I do not have infrmation.

I am assuming to manipulate the images, you nees theor workstation
($50,000) or perhaps a software package like Photostop.

What do you mean by "GFA programs don't reserve their memory at
all"? Of course they don't, because they don't have to. When a
program is started, the whole TPA is reserved for that program,
and it neither has to reserve it nor can it do so. It's the
programmers responsibility to release memory that is not needed,
and there's a problem that many GFA programmers often forget
about this.
However, it is perfectly possible to reserve and release memory
in GFA using the MALLOC() and MFREE() functions. GFA programs
doing this are no more exceptional than any other programs doing
this.

4754. Searching a high level prog. lib

Newsgroup: comp.sys.atari.st
Date: 1992-10-28 20:41:32 UTC
From: leonp@cs.kun.nl
Message-ID: <BwuMt8.5H6@sci.kun.nl>
Source record: 215511

Hello everybody,
As I intend to do a lot of programming in the near future on my atari
I'm looking for some libraries that support gem programming.
I would say like to have a function that dispatches my events and one
that installsredrawfunctions on windows etc.
You get the drift?
Such a lib could save me a lot of time (otherwise I would have to write it
myself...).
I've heard of one such lib called MAGIC or such for modula-2.
Does anybody have anymore info on this one. Is it PD /ShareWare/Commercial
and how can I get it?
Are there equivalent libs?
I prefer PD or Shareware.
The language should be either modula-2 (I really like it) or c.

Can anybody help me with my search?
I will summarize any answers I get...

Thnx

Hi Folks,

Requested on behalf of a friend - is there a driver for the Canon bubble-jet printer for Pagestream 1.8?

Many thanks,

>You are correct, they have already effected the price of Drams.

>1 Meg simms are up in price 40%.

>It will probably effect the Falcon.

I don't understand - why should prices go up so high - the tariffs
are imposed so that the Koreans sell their chips at the same price as what
the Japanese were selling their chips for, but if the dumping was recent,
why don't the chip prices go to the price they were at a couple of weeks
ago (about 5-10% more than right now), rather than sailing past that and
going back to what they were priced at about 2-3 years ago?

Sounds like the chip manufactureres/distributers are taking advantage
of the fact that there will be a slight supply shortage (as less shipments of
Korean drams take place with the tariffs) and will be artificially raising
prices beyond the effect of the Koreans. Am I missing something here?

I am looking for the phone number (or even the address of) Dr. T's software.
I'm interested in upgrading from KCS Level 2 3.0 to OMEGA. The old number,
1-617-244-1542 is no longer Dr. T's. Can anyone help out?

>something like DMJ GIF->SPECTRUM conversion program in the first place?

Well DMJ does much better GIF to SPC conversions than Photochrome.
But the value of Photochrome lies in its new picture format that can
do 96 colors per scanline out of 4096 on a standard ST with a color
monitor (Super HAM ST Pictures are at least twice as good as SPC)!
And on an STE it does 19K colors out of 32K!!! He rightfully calls it
a color board emulator.
Unfortunately the only kludge is that GIF isn't supported which is
why everyone wants to convert to RAW format.

I have uploaded bc.zoo to atari.archive.umich.edu. I have only uploaded the binaries since I don't have Bison/Flex installed, so the one small hack I had to do was done on the generated scanner, no the flex source.

Anyway, for those that don't know, here's the man entry:

bc(1) USER COMMANDS bc(1)

NAME
bc - An arbitrary precision calculator language

SYNTAX
bc [-lws] [file ...]

VERSION
This man page documents GNU bc version 1.02.

DESCRIPTION
bc is a language that supports arbitrary precision numbers with interactive execution of statements. There are some similarities in the syntax to the C programming language. A standard math library is available by command line option. If requested, the math library is defined before processing any files. bc starts by processing code from all the files listed on the command line in the order listed. After all files have been processed, bc reads from the standard input. All code is executed as it is read. (If a file contains a command to halt the processor, bc will never read from the standard input.)

This version of bc contains several extensions beyond tradi-
tional bc implementations and the POSIX draft standard. Command line options can cause these extensions to print a warning or to be rejected. This document describes the language accepted by this processor. Extensions will be identified as such.

OPTIONS
-l Define the standard math library.

-w Give warnings for extensions to POSIX bc.

-s Process exactly the POSIX bc language.

NUMBERS
The most basic element in bc is the number. Numbers are arbitrary precision numbers. This precision is both in the integer part and the fractional part. All numbers are

represented internally in decimal and all computation is done in decimal. (This version truncates results from divide and multiply operations.) There are two attributes of numbers, the length and the scale. The length is the total number of significant decimal digits in a number and the scale is the total number of decimal digits after the decimal point. For example:
.000001 has a length of 6 and scale of 6.
1935.000 has a length of 7 and a scale of 3.

VARIABLES
Numbers are stored in two types of variables, simple

variables and arrays. Both simple variables and array variables are named. Names begin with a letter followed by any number of letters, digits and underscores. All letters must be lower case. (Full alpha-numeric names are an extension. In POSIX bc all names are a single lower case letter.) The type of variable is clear by the context because all array variable names will be followed by brackets ([]).

There are four special variables, scale, ibase, obase, and last. scale defines how some operations use digits after the decimal point. The default value of scale is 0. ibase and obase define the conversion base for input and output numbers. The default for both input and output is base 10. last (an extension) is a variable that has the value of the last printed number. These will be discussed in further detail where appropriate. All of these variables may have values assigned to them as well as used in expressions.

COMMENTS
Comments in bc start with the characters /* and end with the characters */. Comments may start anywhere and appear as a single space in the input. (This causes comments to delimit other input items. For example, a comment can not be found in the middle of a variable name.) Comments include any newlines (end of line) between the start and the end of the comment.

EXPRESSIONS
The numbers are manipulated by expressions and statements. Since the language was designed to be interactive, statements and expressions are executed as soon as possible. There is no "main" program. Instead, code is executed as it is encountered. (Functions, discussed in detail later, are defined when encountered.)

A simple expression is just a constant. bc converts constants into internal decimal numbers using the current input base, specified by the variable ibase. (There is an exception in functions.) The legal values of ibase are 2 through 16 (F). Assigning a value outside this range to ibase will result in a value of 2 or 16. Input numbers may contain the characters 0-9 and A-F. (Note: They must be capitals. Lower case letters are variable names.) Single digit numbers always have the value of the digit regardless of the value of ibase. (i.e. A = 10.) For multi-digit numbers, bc changes all input digits greater or equal to ibase to the value of ibase-1. This makes the number FFF always be the largest 3 digit number of the input base.

Full expressions are similar to many other high level languages. Since there is only one kind of number, there are no rules for mixing types. Instead, there are rules on

the scale of expressions. Every expression has a scale. This is derived from the scale of original numbers, the operation performed and in many cases, the value of the variable scale. Legal values of the variable scale are 0 to the maximum number representable by a C integer.

In the following descriptions of legal expressions, "expr" refers to a complete expression and "var" refers to a simple or an array variable. A simple variable is just a
name
and an array variable is specified as
name[expr]
Unless specifically mentioned the scale of the result is the maximum scale of the expressions involved.

- expr
The result is the negation of the expression.

++ var
The variable is incremented by one and the new value is the result of the expression.

-- var
The variable is decremented by one and the new value is the result of the expression.

var ++
The result of the expression is the value of the variable and then the variable is incremented by one.

var --
The result of the expression is the value of the vari-

able and then the variable is decremented by one.

expr + expr
The result of the expression is the sum of the two expressions.

expr - expr
The result of the expression is the difference of the two expressions.

expr * expr
The result of the expression is the product of the two expressions.

expr / expr
The result of the expression is the quotient of the two expressions. The scale of the result is the value of the variable scale.

expr % expr

GNU software Last change: . 3

bc(1) USER COMMANDS bc(1)

The result of the expression is the "remainder" and it is computed in the following way. To compute a%b, first a/b is computed to scale digits. That result is used to compute a-(a/b)*b to the scale of the maximum of scale+scale(b) and scale(a). If scale is set to zero and both expressions are integers this expression is the integer remainder function.

expr ^ expr
The result of the expression is the value of the first raised to the second. The second expression must be an integer. (If the second expression is not an integer, a warning is generated and the expression is truncated to get an integer value.) The scale of the result is scale if the exponent is negative. If the exponent is positive the scale of the result is the minimum of the scale of the first expression times the value of the exponent and the maximum of scale and the scale of the first expression. (e.g. scale(a^b) = min(scale(a)*b, max(scale, scale(a))).) It should be noted that expr^0 will always return the value of 1.

(expr)
This alters the standard precedence to force the evaluation of the expression.

var = expr
The variable is assigned the value of the expression.

var <op>= expr
This is equivalent to "var = var <op> expr" with the
exception that the "var" part is evaluated only once.
This can make a difference if "var" is an array.

Relational expressions are a special kind of expression
that always evaluate to 0 or 1, 0 if the relation is false
and 1 if the relation is true. These may appear in any
legal expression. (POSIX bc requires that relational
expressions are used only in if, while, and for statements
and that only one relational test may be done in them.) The
relational operators are

expr1 < expr2
The result is 1 if expr1 is strictly less than expr2.

expr1 <= expr2
The result is 1 if expr1 is less than or equal to
expr2.

expr1 > expr2
The result is 1 if expr1 is strictly greater than
expr2.

GNU software Last change: . 4

bc(1) USER COMMANDS bc(1)

expr1 >= expr2
The result is 1 if expr1 is greater than or equal to
expr2.

expr1 == expr2
The result is 1 if expr1 is equal to expr2.

expr1 != expr2
The result is 1 if expr1 is not equal to expr2.

Boolean operations are also legal. (POSIX bc does NOT have
boolean operations). The result of all boolean operations
are 0 and 1 (for false and true) as in relational expres-
sions. The boolean operators are:

!expr
The result is 1 if expr is 0.

expr && expr
The result is 1 if both expressions are non-zero.

expr || expr
The result is 1 if either expression is non-zero.

The expression precedence is as follows: (lowest to highest)
|| operator, left associative
&& operator, left associative
! operator, nonassociative

Relational operators, left associative
Assignment operator, right associative
+ and - operators, left associative
*, / and % operators, left associative
^ operator, right associative
unary - operator, nonassociative
++ and -- operators, nonassociative

This precedence was chosen so that POSIX compliant bc programs will run correctly. This will cause the use of the relational and logical operators to have some unusual behavior when used with assignment expressions. Consider the expression:
a = 3 < 5

Most C programmers would assume this would assign the result of "3 < 5" (the value 1) to the variable "a". What this does in bc is assign the value 3 to the variable "a" and then compare 3 to 5. It is best to use parenthesis when using relational and logical operators with the assignment operators.

There are a few more special expressions that are provided in bc. These have to do with user defined functions and

standard functions. They all appear as "name(parameters)". See the section on functions for user defined functions. The standard functions are:

length (expression)
The value of the length function is the number of significant digits in the expression.

read ( )
The read function (an extension) will read a number from the standard input, regardless of where the function occurs. Beware, this can cause problems with the mixing of data and program in the standard input. The best use for this function is in a previously written program that needs input from the user, but never allows program code to be input from the user. The value of the read function is the number read from the standard input using the current value of the variable ibase for the conversion base.

scale (expression)
The value of the scale function is the number of digits after the decimal point in the expression.

sqrt (expression)
The value of the sqrt function is the square root of the expression. If the expression is negative, a run time error is generated.

STATEMENTS
Statements (as in most algebraic languages) provide the sequencing of expression evaluation. In bc statements are executed "as soon as possible." Execution happens when a newline in encountered and there is one or more complete statements. Due to this immediate execution, newlines are very important in bc. In fact, both a semicolon and a newline are used as statement separators. An improperly placed newline will cause a syntax error. Because newlines are statement separators, it is possible to hide a newline by using the backslash character. The sequence "\<nl>", where <nl> is the newline appears to bc as whitespace instead of a newline. A statement list is a series of statements separated by semicolons and newlines. The following is a list of bc statements and what they do: (Things enclosed in brackets ([]) are optional parts of the statement.)

expression
This statement does one of two things. If the expression starts with "<variable> <assignment> ...", it is considered to be an assignment statement. If the expression is not an assignment statement, the expression is evaluated and printed to the output. After the

number is printed, a newline is printed. For example, "a=1" is an assignment statement and "(a=1)" is an expression that has an embedded assignment. All numbers that are printed are printed in the base specified by the variable obase. The legal values for obase are 2 through BC_BASE_MAX. (See the section LIMITS.) For bases 2 through 16, the usual method of writing numbers is used. For bases greater than 16, bc uses a multi-character digit method of printing the numbers where each higher base digit is printed as a base 10 number. The multi-character digits are separated by spaces. Each digit contains the number of characters required to represent the base ten value of "obase-1". Since numbers are of arbitrary precision, some numbers may not be printable on a single output line. These long numbers will be split across lines using the "\" as the last character on a line. The maximum number of characters printed per line is 70. Due to the interactive nature of bc printing a number cause the side effect of assigning the printed value the the special

variable last. This allows the user to recover the last value printed without having to retype the expression that printed the number. Assigning to last is legal and will overwrite the last printed value with the assigned value. The newly assigned value will remain until the next number is printed or another value is assigned to last.

string
The string is printed to the output. Strings start with a double quote character and contain all characters until the next double quote character. All characters are take literally, including any newline. No newline character is printed after the string.

print list
The print statement (an extension) provides another method of output. The "list" is a list of strings and expressions separated by commas. Each string or expression is printed in the order of the list. No terminating newline is printed. Expressions are evaluated and their value is printed and assigned the the variable last. Strings in the print statement are printed to the output and may contain special characters. Special characters start with the backslash character (\). The special characters recognized by bc are "b" (bell), "f" (form feed), "n" (newline), "r" (carriage return), "t" (tab), and "\" (backslash). Any other character following the backslash will be ignored. This still does not allow the double quote character to be part of any string.

{ statement_list }
This is the compound statement. It allows multiple statements to be grouped together for execution.

if (expression) then statement1 [else statement2]
The if statement evaluates the expression and executes statement1 or statement2 depending on the value of the expression. If the expression is non-zero, statement1 is executed. If statement2 is present and the value of the expression is 0, then statement2 is executed. (The else clause is an extension.)

while (expression) statement
The while statement will execute the statement while the expression is non-zero. It evaluates the expression before each execution of the statement. Termina-

tion of the loop is caused by a zero expression value
or the execution of a break statement.

for ([expression1] ; [expression2] ; [expression3]) statement
The for statement controls repeated execution of the
statement. Expression1 is evaluated before the loop.
Expression2 is evaluated before each execution of the
statement. If it is non-zero, the statement is
evaluated. If it is zero, the loop is terminated.
After each execution of the statement, expression3 is
evaluated before the reevaluation of expression2. If
expression1 or expression3 are missing, nothing is
evaluated at the point they would be evaluated. If
expression2 is missing, it is the same as substituting
the value 1 for expression2. (The optional expressions
are an extension. POSIX bc requires all three expres-
sions.) The following is equivalent code for the for
statement:
expression1;
while (expression2) {
statement;
expression3;
}

break
This statement causes a forced exit of the most recent
enclosing while statement or for statement.

continue
The continue statement (an extension) causes the most
recent enclosing for statement to start the next itera-
tion.

halt The halt statement (an extension) is an executed state-
ment that causes the bc processor to quit only when it
is executed. For example, "if (0 == 1) halt" will not

GNU software Last change: . 8

bc(1) USER COMMANDS bc(1)

cause bc to terminate because the halt is not executed.

return
Return the value 0 from a function. (See the section
on functions.)

return (expression)
Return the value of the expression from a function.
(See the section on functions.)

PSEUDO STATEMENTS
These statements are not statements in the traditional

sense. They are not executed statements. Their function is performed at "compile" time.

limits
Print the local limits enforced by the local version of bc. This is an extension.

quit When the quit statement is read, the bc processor is terminated, regardless of where the quit statement is found. For example, "if (0 == 1) quit" will cause bc to terminate.

warranty
Print a longer warranty notice. This is an extension.

FUNCTIONS
Functions provide a method of defining a computation that can be executed later. Functions in bc always compute a value and return it to the caller. Function definitions are "dynamic" in the sense that a function is undefined until a definition is encountered in the input. That definition is then used until another definition function for the same name is encountered. The new definition then replaces the older definition. A function is defined as follows:
define name (parameters) { newline
auto_list statement_list }
A function call is just an expression of the form "name(parameters)".

Parameters are numbers or arrays (an extension). In the function definition, zero or more parameters are defined by listing their names separated by commas. Numbers are only call by value parameters. Arrays are only call by variable. Arrays are specified in the parameter definition by the notation "name[]". In the function call, actual parameters are full expressions for number parameters. The same notation is used for passing arrays as for defining array parameters. The named array is passed by variable to the function. Since function definitions are dynamic, parameter numbers and types are checked when a function is called.

Any mismatch in number or types of parameters will cause a runtime error. A runtime error will also occur for the call to an undefined function.

The auto_list is an optional list of variables that are for "local" use. The syntax of the auto list (if present) is "auto name, ... ;". (The semicolon is optional.) Each name is the name of an auto variable. Arrays may be specified by

using the same notation as used in parameters. These variables have their values pushed onto a stack at the start of the function. The variables are then initialized to zero and used throughout the execution of the function. At function exit, these variables are popped so that the original value (at the time of the function call) of these variables are restored. The parameters are really auto variables that are initialized to a value provided in the function call. Auto variables are different than traditional local variables in the fact that if function A calls function B, B may access function A's auto variables by just using the same name, unless function B has called them auto variables. Due to the fact that auto variables and parameters are pushed onto a stack, bc supports recursive functions.

The function body is a list of bc statements. Again, statements are separated by semicolons or newlines. Return statements cause the termination of a function and the return of a value. There are two versions of the return statement. The first form, "return", returns the value 0 to the calling expression. The second form, "return (expression)", computes the value of the expression and returns that value to the calling expression. There is an implied "return (0)" at the end of every function. This allows a function to terminate and return 0 without an explicit return statement.

Functions also change the usage of the variable ibase. All constants in the function body will be converted using the value of ibase at the time of the function call. Changes of ibase will be ignored during the execution of the function except for the standard function read, which will always use the current value of ibase for conversion of numbers.

MATH LIBRARY
If bc is invoked with the -l option, a math library is preloaded and the default scale is set to 20. The math functions will calculate their results to the scale set at the time of their call. The math library defines the following functions:

s (x)
The sine of x in radians.

c (x)
The cosine of x in radians.

a (x)
The arctangent of x.

```
l (x)
The natural logarithm of x.

e (x)
The exponential function of raising e to the value x.

j (n,x)
The bessel function of integer order n of x.

EXAMPLES
In /bin/sh, the following will assign the value of "pi" to
the shell variable pi.

pi=$(echo "scale=10; 4*a(1)" | bc -l)

The following is the definition of the exponential function
used in the math library. This function is written in POSIX
bc.

scale = 20

/* Uses the fact that e^x = (e^(x/2))^2
When x is small enough, we use the series:
e^x = 1 + x + x^2/2! + x^3/3! + ...
*/

define e(x) {
auto a, d, e, f, i, m, v, z

/* Check the sign of x. */
if (x<0) {
m = 1
x = -x
}

/* Precondition x. */
z = scale;
scale = 4 + z + .44*x;
while (x > 1) {
f += 1;
x /= 2;
}

/* Initialize the variables. */
v = 1+x

GNU software Last change: . 11

bc(1) USER COMMANDS bc(1)

a = x
d = 1

for (i=2; 1; i++) {
e = (a *= x) / (d *= i)
if (e == 0) {
```

```
if (f>0) while (f--) v = v*v;
scale = z
if (m) return (1/v);
return (v/1);
}
v += e
}
}
```

The following is code that uses the extended features of bc to implement a simple program for calculating checkbook balances. This program is best kept in a file so that it can be used many times without having to retype it at every use.

```
scale=2
print "\nCheck book program!\n"
print " Remember, deposits are negative transactions.\n"
print " Exit by a 0 transaction.\n\n"

print "Initial balance? "; bal = read()
bal /= 1
print "\n"
while (1) {
"current balance = "; bal
"transaction? "; trans = read()
if (trans == 0) break;
bal -= trans
bal /= 1
}
quit
```

The following is the definition of the recursive factorial function.

```
define f (x) {
if (x <= 1) return (1);
return (f(x-1) * x);
}
```

DIFFERENCES
This version of bc was implemented from the POSIX P1003.2/D11 draft and contains several differences and extensions relative to the draft and traditional

GNU software Last change: . 12

bc(1) USER COMMANDS bc(1)

implementations. It is not implemented in the traditional way using dc(1). This version is a single process which parses and runs a byte code translation of the program. There is an "undocumented" option (-c) that causes the program to output the byte code to the standard output instead

of running it. It was mainly used for debugging the parser and preparing the math library.

A major source of differences is extensions, where a feature is extended to add more functionality and additions, where new features are added. The following is the list of differences and extensions.

LANG This version does not conform to the POSIX standard in the processing of the LANG environment variable and all environment variables starting with LC_.

names
Traditional and POSIX bc have single letter names for functions, variables and arrays. They have been extended to be multi-character names that start with a letter and may contain letters, numbers and the underscore character.

Strings
Strings are not allowed to contain NUL characters. POSIX says all characters must be included in strings.

last POSIX bc does not have a last variable. Some implementations of bc use the period (.) in a similar way.

comparisons
POSIX bc allows comparisons only in the if statement, the while statement, and the second expression of the for statement. Also, only one relational operation is allowed in each of those statements.

if statement, else clause
POSIX bc does not have an else clause.

for statement
POSIX bc requires all expressions to be present in the for statement.

&&, ||, !
POSIX bc does not have the logical operators.

read function
POSIX bc does not have a read function.

print statement
POSIX bc does not have a print statement .

continue statement
POSIX bc does not have a continue statement.

array parameters
POSIX bc does not have array parameters. Other implementations of bc may have call by value array parameters.

=+, =-, =*, =/, =%, =^
POSIX bc does not require these "old style" assignment operators to be defined. This version may allow these "old style" assignments. Use the limits statement to see if the installed version supports them. If it does support the "old style" assignment operators, the statement "a =- 1" will decrement a by 1 instead of setting a to the value -1.

spaces in numbers
Other implementations of bc allow spaces in numbers. For example, "x=1 3" would assign the value 13 to the variable x. The same statement would cause a syntax error in this version of bc.

errors and execution
This implementation varies from other implementations in terms of what code will be executed when syntax and other errors are found in the program. If a syntax error is found in a function definition, error recovery tries to find the beginning of a statement and continue to parse the function. Once a syntax error is found in the function, the function will not be callable and becomes undefined. Syntax errors in the interactive execution code will invalidate the current execution block. The execution block is terminated by an end of line that appears after a complete sequence of statements. For example,
a = 1
b = 2
has two execution blocks and
{ a = 1
b = 2 }
has one execution block. Any runtime error will terminate the execution of the current execution block. A runtime warning will not terminate the current execution block.

Interrupts
During an interactive session, the SIGINT signal (usually generated by the control-C character from the terminal) will cause execution of the current execution block to be interrupted. It will display a "runtime" error indicating which function was interrupted. After all runtime structures have been cleaned up, a message

will be printed to notify the user that bc is ready for more input. All previously defined functions remain defined and the value of all non-auto variables are the value at the point of interruption. All auto variables and function parameters are removed during the clean up process. During a non-interactive session, the SIGINT signal will terminate the entire run of bc.

LIMITS
The following are the limits currently in place for this bc processor. Some of them may have been changed by an installation. Use the limits statement to see the actual values.

BC_BASE_MAX
The maximum output base is currently set at 999. The maximum input base is 16.

BC_DIM_MAX
This is currently an arbitrary limit of 65535 as distributed. Your installation may be different.

BC_SCALE_MAX
The number of digits after the decimal point is limited to INT_MAX digits. Also, the number of digits before the decimal point is limited to INT_MAX digits.

BC_STRING_MAX
The limit on the number of characters in a string is INT_MAX characters.

exponent
The value of the exponent in the raise operation (^) is limited to LONG_MAX.

multiply
The multiply routine may yield incorrect results if a number has more than LONG_MAX / 90 total digits. For 32 bit longs, this number is 23,860,929 digits.

code size
Each function and the "main" program are limited to 10240 bytes of compiled byte code each. This limit (BC_MAX_SEGS) can be easily changed to have more than 10 segments of 1024 bytes.

variable names
The current limit on the number of unique names is 32767 for each of simple variables, arrays and functions.

FILES
In most installations, bc is completely self-contained.

GNU software Last change: . 15

Where executable size is of importance or the C compiler
does not deal with very long strings, bc will read the stan-
dard math library from the file /usr/local/lib/libmath.b.
(The actual location may vary. It may be /lib/libmath.b.)

DIAGNOSTICS
If any file on the command line can not be opened, bc will
report that the file is unavailable and terminate. Also,
there are compile and run time diagnostics that should be
self-explanatory.

BUGS
Error recovery is not very good yet.

AUTHOR
Philip A. Nelson
phil@cs.wwu.edu

ACKNOWLEDGEMENTS
The author would like to thank Steve Sommars
(sesv@iwtsf.att.com) for his extensive help in testing the
implementation. Many great suggestions were given. This is
a much better product due to his involvement.

Upss,EYE OF BEHOLDER for ST?? Where and when had SSI released it?
I never heard anything about an conversion for ST here in europe.
Please give me an address or info where i can order it,coz i REALLLYYY
love their AD&D games.
I have only Curse of the Azure Bonds and Hillsfar and WANT more of this
stuff.
Besides,i have no idea why you hate the conversions by SSI for ST.They are
highly playable and much funny for me (NOTE:I'm definitly NOT a masochist!)
Anyway,give me information about this

I just heard that Texas and Micron (the only two american dram suppliers)
have stopped selling there chips: they wait for the prices to go up !!!

Anyway, the prices are going up and whether subject to taxes or not is
irrelevant (as was shown back in 88)

Yes. For gemini, put the icons in the proper places, then sort (as it says in
the docs). (the sort is only needed if you are adding new icons)

Does TeraDesk have any advantages over Gemini?

4768. Re: Very general uucp question

Newsgroup: comp.sys.atari.st
Date: 1992-10-29 02:45:58 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.ea.pYLF7Kokoqs@harvee.billerica.ma.us>
Source record: 215533

I am assuming you are wondering about UUCP mail and news on an ST. if
you want to know about dos or mac, the modem speed and disk size
discussion is still relative. send me mail for a dos/mac uucp
program suppliers FAQ.

In <1cl1a0INN4vb@usenet.INS.CWRU.Edu>, Brian Jepson writes:
>
>I think the subject says it all. Can someone provide or direct to answers to
>these questions:
>
> * what reasonable machine requirements are

assuming you want to be a leaf site with a small news feed, you need:

0) an st(e) with 2 meg of ram (some folks claim you can run in 1 meg
but I've had problems.)

1) a modem that can handle your load. use nothing slower than 2400 baud.
try to get a modem that will keep your connect time to under 30 min/day
unless you have a *real* friendly feed site. the faster the better is
my motto.

2) Lots 'o disk. Figure on 2 meg of disk for hermes executables,
2x daily feed volume for a uucp spool area and 2Nx daily feed volume
for a news spool area. where N=number of days you keep news.
For example, if you get 100k of compressed news batches per day and
expire news every 5 days, you need 200k of uucp spool area and 1mb of
news spool area. note that this volume caluclation is SWAG (scientific
wild ass guess) based on my experiences with harvee. I get 800k of
compressed news/day and on a 4 day expire period, my news spool
disk holds between 5-9 meg of news at any time.

3) cts/rts flow control patches. use serial fix 1.1 (serfx11??). it
works great for me at 19.2k

> * what you need to have access to (modem tyes, host machines, etc.)

for modems, I would suggest sticking to something no faster than V.32.
There are enough problems with "cheap" V.32bis modems to make me
cautious about recomending them to anyone. If you insist on going
with V.32bis, I suggest bying a modem locally, trying to connect with
your feed site and keep returning modems until you get one that works
with *your* phone line. Then you *pray* that the telco does not find
out and come and "fix" your line. 1/2 :-)

Feed site: All you need is some machine running uucp and a
sysadmin willing to let you conect. I hope you have friends with

access to UUCP maps because this is the only way I have been able to
find a site that will let me connect for mail and news.

> * basic outline of what is involved with uucp (the actual process)

at a very gross level, you copy files from one machine to another.
The files are command and data files. the receiving machine looks at
the command files and uses the instructions in them to figure out what
to do with the data files. need more detail?

> * finally, what does one need to know to be able to set one up.

how to: read german :-), edit files, send mail to me, martin, or john.

>
>I imagine that I'm not speaking for myself when I say that, due to the
> questions
>I've been seeing lately, that the process seems very intimidating.

It can be. I helped a fellow in oklohoma set up his ST to be a
usenet node and he vanished from the face of the earth. >poof<
totally gone. (yes terry, I mean you :-)

>All I've been able to suss out is that I will need to read German,
>understand a little about the Internet infrastructure, and have access to
>a machine which I can send my data through. Otherwise, it seems about
>as clear as mud.

Hey, you had it figured out already... :-)

>
> If I *ever* figure this out, I'll post a lucid summary (auf Deutsch :)

just translate the docs and I'll be happy.

Yes. It's quite trivial. What's your problem? Just make sure you
set the protedtion to locked so you don't change the tree order. Orcs
is so easy to use, I don't see what the big need for english docs is.
It has an english resource file, the menu are pretty self explanatory.
Just watch out for selecting c output option 2. It outputs the resource
file only as C source, so you can't re-edit it.

My point was that EOB was the only SSI game I'd seen that looked playable.
I must admit I haven't seen Curse of the Azure Bonds. Is it any good. I have
found most other SSI games to be bad ports with very cheesy graphics, and
no playability, but I guess tastes vary.

Message-ID: <1992Oct29.082236.4525@quando.quantum.de>
Source record: 215523

Michael Park (mpark@stein.u.washington.edu) wrote:
: In article <1992Oct27.100455.8654@quando.quantum.de> vombruch@quando.quantum.de (Stefan vom Bruch) writes:
: ...
: >If you pick up a book about computer graphics you will find that 32 is
: >quite sufficient. There isn't much difference between 32 and 64 and almost
: >no visible difference between 64 and 256.
:
: On page 566 of _Computer Graphics Principles and Practice 2nd Ed_
: by Foley et al, there is a table giving the required number of intensities
: for various media. For CRTs, they list 400-530 intensities. There
: are several B&W examples with varying numbers of intensities, and
: in discussing them the authors state:
:
: "This suggests that 64 intensity levels is the absolute minimum
: needed for contour-free printing of continuous-tone black-and-white
: images on paper... For a well-adjusted CRT in a perfectly black
: room, however, the higher dynamic range means that many more levels
: are demanded." [p567]

In a perfect world, where everybody uses a "well-adjusted CRT in a perfectly black room" 64 intensity levels (or 32 for that matter) certainly won't be enough. I wasn't stating that 64 intensities are perfect but that you won't miss that much when you have 64 instead of 256. Besides we will have to live with it or buy ourselves some colour boards because the Falcon doesn't have more.
But since you've quoted from Foley et al you will also have seen the pictures on the same page with 32 and 64 intensity levels. And the caption under the 64 level picture reads something like: differences from the other picture [the one with 32 levels] are quite subtle.
My English is far from perfect and correct me if I'm wrong but that doesn't that mean "not much of a difference".

: >Besides why anyone would use the 32K/64K colour mode for grey scales is
: >beyond me. If you limit yourself to a fraction of the palette anyway you
: >might as well use a LUT-mode.
: I don't think anyone is seriously advocating using a "true color"
: mode to display gray scale pictures. The point is that if 24-bit
: color can represent all perceivable colors (as some people contend)
: then people should not be able to perceive more than 256 levels of
: gray (which after all is a perfectly valid color).

The point of the original poster was that 32 intensity levels are ridiculous. I've seen the Falcon and I don't think so.

Try getting a hold of DCMXTRX or something like that (it should be on a.a,
if it's not I can send it to you [look in the Dc dir]), it'll tell you how
many tracks your drive can format. As far as I know there isn't an arc'd
version. You could install it on your HD if you could un-MSA it.

BTW, make sure you have the CHAOS from the Games dir. not the Demo dir.

Source record: 215534

You need to install PC-Ditto to run under a mono monitor using the configuration program. The reason the initiall screen works is because the ST auto detects the mono monitor, but once PC-Ditto has installed its self and dos it goes by the set up file. The reason nothing appears on the screen is because PC's use different video memory addresses for mono and colour, namely B000 and B800 resp.

Hope this helps
Tom.

A quick question regarding a particular modem...specifically an ATARI 1000E modem. I have the opportunity to buy such a modem but the seller has said that it works through the JOYSTICK port????? Can this be right? If so how reliable is this set-up? Also, if anyone has used such a modem advice on quality etc. would be appreciated.

As an aside, has anyone ever been successful dialing in
to a site with VT200 terminals. I have never used a modem before and am wondering if I can dial in and successfully use the VAX terminals at school. I assume there would be no problem with the mainframe DOS environment, but even the mainframe sometimes has problems emulating the VAX...any ideas? Can I use the VAX okay? Thanks in advance for any help and/or advice :^)

> >red and 4 bits for blue.

> Which must have made it quite incapable of producing levels of grey (i.e. all
> the greys would look either green, blue or red.)

Actually you can get 16 shades of grey from that system, and you can fudge
it to get 128 pseudo grays, using the same technique that the TT uses. This
system was developed for NASA by Sanders Associates.

If people do not believe that pseudo grays are of no value please view
some of Ringo Monforts (Lexicor) efforts on a TT before you pronounce
this method as of no redeaming value.

While I have yet to see a Falcon, I can appreciate it for what it is. It
is an entry level computer that will outperform most computers available
on the market today. It will not out perform a 80486, but most computers
on the market are not based upon the 80486. Here at BNR many people are
buying computers, and they are buying computers based on the 80386sx and
the 80386dx. Why? Cost. They want a system with a hard-drive and monitor
around $1200, that they can add a soundblaster card, a CD-ROM, and some
stereo speakers to.

Again as I stated earlier the Falcon both DOES and DOES NOT have TRUE COLOR.
It all depends on your needs, and your perceived needs.

Source record: 215535

Excuse me, but am I the only person on the Earth who was singularly unimpressed by Chaos? It seems to me that it's a case of 'nice samples, shame about the game'. The controls are awful, the game is slow, and after five minutes I got very bored.

Don't get me wrong, I'm all for shareware and I have great respect for the authors (I am one!), but wouldn't it be better to concentrate on more original ideas? I mean, shareware is the ideal place for new ideas to come from, as shareware authors aren't bound by deadlines etc. like in the 'real world'?

4788. A Mausnet rumor about MultiTOS

Newsgroup: comp.sys.atari.st
Date: 1992-10-29 13:56:27 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992Oct29.095627.1@uwovax.uwo.ca>
Source record: 215539

It has come to my attention that someone posted a rumor on the Maus network to the effect that Atari has had to delay release of MultiTOS because of a copyright dispute with me.

This is ABSOLUTELY FALSE. Atari has a valid, legal license for the use of MiNT in MultiTOS, and they have fulfilled all of their contractual obligations with respect to that license (as have I). My relations with Atari and with the TOS development group in particular have always been excellent. In fact, I will soon be moving to Sunnyvale to go to work for Atari.

The same Mausnet message had some other reports about the Falcon and FSM-GDOS. My understanding is that these reports are just as false as the MultiTOS rumor.

The above are my opinions only; Atari is hiring me to work on TOS and other systems software, not to issue official statements :-).

Hi Bert,
I think, the only C++ Compiler for the Atari ST is the GNU-C++ (GPP).
It is an Public-Domain-Compiler which is available on many
anonymous-ftp servers.
On the 'ATARI-MESSE' in Duesseldorf in August 92 I asked one of the Pure-C
develloppers, if they were planing a Pure-C++ version for the Atari-ST
and he told me that they would probably develop a not complete C++
Version, which could be ready in 1993.

Apple's current CD-ROM drive, the CD300 (which is a double-speed, 300 KB/sec. transfer rate drive, by the way), is capable of reading multi-session Photo-CDs. It comes with system software extensions which provide transparent OS-level support for the Photo-CD format. The newest Macs which include built-in CD-ROM drives have this software pre-installed on disk. You can open and manipulate the Photo-CD files in pretty much any Mac program that does image editing on PICT files (which is Apple's standard graphics file format). This pretty much means that _any_ Mac graphics program can transparently access Photo-CD files.

>a color board emulator.
> Unfortunately the only kludge is that GIF isn't supported which is
>why everyone wants to convert to RAW format.

The increase in colors which the Photochrome format allows is useless when converting a GIF-format picture to be viewed on an ST. The primary reason for this is that a standard GIF-format picture is limited to 256 colors. Period. Conversion to SPECTRUMf-format pictures is actually a bit of overkill.

However, there are GIF-format pictures which cover an area greater than 320 x 200 pixels, and a 'travelling mat' SPECTRUM viewer, where one could move horizontally as well as vertically (the SPX-format only goes vertically as far as I have been able to ascertain), would be most welcome.

I have been greatly impressed with the results of Photochrome on ray-traced pictures which are output originally in RAW format, where one is not limited to a small color palette.

The problem I had with using ORCS was that, although I could see the ICONS.RSC file by clicking on the appropriate drive icon (on the ORCS desktop), nothing I tried would open the ICONS.RSC file so that I could access the resource objects within.

I didn't try to interpret the German documentation; having had access to other Resource Editors in the past, I assumed ORCS would work in a similar manner. I put the program (and the attempt to modify the ICONS.RSC file) on hold for the time being.

This is a good definition. If we were to establish a new industry standard
for what the marketing term "true colour" really means, this would be a
good way to put it. However, until there is such a standard, "true colour"
is still a nebulous marketing term as far as I know, and Atari is more
or less free to call the Falcon true colour if they want. The best thing
is to just stop using the term, call it 16-bit RGB on the Falcon. IMO.

>> I remember hearing rumours a month or two ago, of a product called
>>GEMULATOR which was a ST emulator for PCs.
>>Does such a product exist?
>
>I will throw in a me too on this also. I would be *very* interested in
>any news of this product.

Yes it does! It has been shipping for almost two months and is available
from ST and PC dealers in Canada and the U.S. See ads in Atari User, ST
Informer, Atari Advantage, Current Notes, and other Atari magazines for
ordering information.

The Gemulator package comes with a plug-in board for your PC, a set of TOS
2.06 ROMs (and the board has room for 6 more TOS chips, either TOS 1.0 or
TOS 1.4), and emulation software that you run on your PC.

It emulates 4 graphics modes:
- ST Low (320x200 16 colors)
- ST Medium (640x200 4 colors)
- ST High (640x400 mono)
- TT medium (640x480 16 colors)

out of a palette of 4096 colors (same as the STE), and allows you to toggle
between color and monochrome with one keystroke (since a VGA monitor can do
all resolutions, you do not need two separate monitors on your PC), it
reads and writes to 360K, 400K, 720K, 800K, and 1.44 meg MS-DOS disks, even
disks formatted on the Atari ST using TOS 1.0, reads and writes to the
hard disk (but there is a 32 megabyte per partition limit imposed by GEMDOS),
supports the mouse and printer, and sound joystick and modem support will be
added shortly.

Programs such as Calamus SL, Pagestream, Prism Paint, Word Writer, etc, all
run fine on Gemulator.

Hardware requirements are: a 386 or 486 PC running DOS or Windows, at least
4 megabytes of RAM, a hard disk, and a VGA monitor. The amount of ST RAM
emulated is limited by your PC's RAM. On a 4 megabyte PC you can emulate a
512K ST, on an 8 megabyte PC you can emulate between 512K and 5 meg of ST
RAM, and with 12 meg or more you can emulate up to an 8 megabyte ST. Of
course with virtual memory (such as under Windows) you require less RAM but
it runs slower.

The product was recently shown at the Glendale and WAACE shows and it is definitely not vaporware as some people seem to think. It's already in use by over 250 users.

> ($50,000) or perhaps a software package like Photostop.

I was at the winter CES in Vegas, and saw and played with the Photo CD system quite a bit (`cheap photo digitizing' was my first thought). It's stored as a normal JPEG (I think) picture file on the CD-ROM, and any computer that can handle an XA CD-ROM can read it. Any program that can handle JPEG pics can handle photo-CD pics.

The Mac people want you to think that they have some special advantage here, but they don't. You can have the same capabilities with any computer (PC, Mac, ST, Amiga, NeXT, etc. etc.) given the basic software.

I hope that clears up a few things... (btw, Photostop did work nicely for playing with photo-CD images... Splicing a giant parrot onto a city like a Japanese monster movie was amusing...)

None of the companies are perfect but Atari hasn't done anything to improve
their customer relationships. As far as fixing, I don't understand what you
mean by "Fixing." I have fixed many things, including the Atari machine I
own (And yes, Atari was not capable of doing it). On the other hand, I fixed
those problems. How? I went and purchased another computer system. This is
a very simple solution....

You are still avoiding the issue! You include part of my message and you still have _NOTHING_ to say about my point. Why? Because it's the truth and you don't know what to say. Is "After reading 93 lines of your drivel..." the best you can come up with? For a contributing editor you wouldn't get a job to write for Walt Disney Corp.

Mr. Brodie put me in his twit list because he can't listen to the facts. Well, tell him to start looking for another job. What he has done and what he has posted in the last year is unreal and you seem to take his advice. You publish a magazine, AE, and you have access to all the information. Nevertheless, it is the worse magazine I have seen. How about quality writing and not the general rehashed Atari cheering?

Have a nice day,
Mark K.

>(eg. 640x480x256).
>
>-MY
>

I think what he's asking is how the 65536 colors are chosen in the true color modes. The Falcon has an 18-bit palette for non TC modes, allowing 64 levels of Red, Green, and Blue. Now, the TC mode, you get 32 levels each of Red and Blue, and 64 levels of Green. The question is, does this mean it's impossible in TC to select a color which might be available if you had the full palette in the non TC modes? Put a different way, can you somehow have different techniques in TC modes to get different sets of 65536 colors or is it always exactly the same 65536 colors to choose from for each pixel? You get the idea... It's kind of an insignificant detail, but an interesting one... :-)

And yes, I think we've decided that True Color is not a specific term in any way -- let's just admit that the Falcon has _plenty_ of colors for almost any conceivable application and leave it at that... :)

Well, it seems this is more an issue for developers than for Atari itself.
Any program can be resolution independent if it's programmed that way.
(Note how programs like Calamus and GemView and Lexicor software will
detect a new graphics card or resolution and work in it.

So, programs which are written well to conform to the mode they're in
will run fine... programs which don't check which mode they're in
may look really funky or even unreadable in different modes. For
these kind of programs, you'll have to switch the Falcon into the
ST mode the program was meant to run in.

Well, according to MacWeek, the new drives do NOT support multi-
session photo-cds...only single session cds (this is for the CD300).
Apparently they will release a newer version that will support multi-session
photoCDs in the future (I don't remember any dates tho.).

> The newest
>Macs which include built-in CD-ROM drives have this software pre-installed

>graphics program can transparently access Photo-CD files.

Yes and no. The cd-ROM drivers will be supportd by the new System7.1
so any new machines that get the new system will be able to support the
Apple CD-roms (and probably most 3rd party ones as well, but that is just
speculation on my part). You will only be able to manipulate Photo-CD files
by software that understands the format - it is not Pict or any of the common
formats for Mac, so you will probably have to get a software update to
manipulate Photo-CD files.

Sounds like a *very* serious magazine ... how can you possibly
push a 33 Mhz (40 Mzh soon) '040 to 60 Mhz ??? Answer : you can't !!!

True, you can push a processor beyond it's specs but within
reasonable limits.

Perhaps I'm showing my Atari programming ignorance, but does anyone know how
to select a particular shade of grey in this mode? In other words, which
RGB values correspond to which grey values?

4826. Student discounts?

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 02:11:23 UTC
From: gordonf@monashee.sfu.ca
Message-ID: <1992Oct30.021123.13429@sfu.ca>
Source record: 215372

I showed a friend of mine and article about the Falcon that appeared in the Canadian magazine "The Computer Paper" this month, and he was impressed. In fact he was impressed enough to consider buying one. What he wants to know first, though, is whether or not there is student pricing available from Atari. I told him I had no idea, but I'd ask here.

So, how 'bout it? Anyone know, or should I tell him to bite the bullet and call Atari and ask them?

Please e-mail, as I've been having trouble keeping up with this group, lately.

Who cares if it's true colour! IBM's VGA mode (640*480*256 or whatever it is) looks GREAT! 256-colours at once, with a pretty high resolution - the pictures I've seen look INCREDIBLE!!

19200 colours on a 320*200 screen (e.g. Photochrome) is POINTLESS - the resolution is too low for there to be any point - lots of colours don't (always) make up for few pixels!

Instead of inventing higher-graphics modes, programmers just need to work a little harder on some of the not-as-fancy ones!!

>Now. It's the older CD150 drive that only supports a single session.

It very possible that they stated it correctly and I paraphrased it incorrectly. Consider my memory to be a lossy compression. :) Since I have already disposed of the MacWeek in question, perhaps you can answer this: Will the Performa600CDs ship with the CD150 or the CD300? I assume it will be available (for a price!) as a standalone too...

<erronious garbage littered by me erased>

>Sorry, but this is simply not the case. All you need is QuickTime 1.5 and
>the new CD-ROM driver software (version 4.01, I believe). System 7.1 is

>to any Mac program in much the same way as it does with JPEG files. I.e.,
>_any_ program which can access a PICT file can transparently access a
>Photo-CD or JPEG file. Most people concentrate on QuickTime's video
>playback capability, but this foreign file access transparency is one of
>the real advantages of QuickTime.

Now this I know - the article never mentioned QuickTime so I had assumed (yes you guessed what that did) the Photo-CD abilities stemmed from the System7.1 as they had termed it "system support" rather than QuickTime support. This is a very cool feature of QuickTime that I was not aware of, but then again, I haven't been all that up-to-date with QuickTime software as I rarely need it. BTW, which (if not all) of the Photo-CD images are available through QTime (base/16, base/4, base, base4, base16, or all)?

Now all we need is an Atari version of QuickTime and we'd be set! :)

>Next time, check your facts before you post. There's enough mis-
>information being circulated already.

Just trying to deal with the information I _do_ get. At a time like this, though, I like that old saying about "we learn more by our mistakes ..."

:)

Source record: 215376

This is an academic argument. Whatever you CALL the Falcon's graphic capabilities does not change those capabilities.

The "Does NOT" side's only point could be "They are lying to sell more computers". Which is silly. People will never be happy with the statement "True Colour" anyway, they'll always want to know what the ACTUAL features of the machine are, not which marketing terms have been attached to it.

I don't think so, but you could write a simple program to do that,
then call it with the "RUN" macros, and check it's return code.

Pity Uniterm doesn't have a READSTRING macro - then you could read a string
and compare it against other strings with IF.

>>> Every SSI game I ever bought for the ST wasn't worth a darn. I
>>>didn't buy the Phantasie series, but they looked like Ultima clones
>>>with worse graphics.

I enjoyed Phantasie I. Phantasie II was improved in the graphics department and even the playability department. I haven't gotten to P. III as I'm just starting #2.

I actually prefer the Phantasie series to Ultima. They are good for hack and slash fun and have some interesting (if somewhat simplistic) puzzles to solve.

A game doesn't have to have tremendous graphics and sound to be a highly enjoyable game. Look at Chaos, the graphics aren't anything to write home about (sounds are GREAT), but the game is still fun to play.

I do agree that most SSI ports have been poorly integrated with the ST, though. A prime example of this is "Rings of Zilfin" -- the game sounded interesting and it even looked fairly decent, but the interface was LOUSY!!!

I guess my point is that you shouldn't condemn a game just because it has poor graphics and/or sound. Infocom produced some of the best games ever made (highly subjective opinion I freely admit) and they have no graphics or sound whatsoever (not counting some of the more recent attempts of course). Judge a game/application on its ability to do what you want and not the pretty package it comes in.

I'll get off of my soapbox now. [and much cheering and hollering at this last announcement was witnessed in the background. 8^P]

Later,
Kenneth Love

This is not correct. PhotoCD is a proprietary format from Kodak. There has
been much discussion over this at alt.cdrom. I'll include a very good
overview from a guy at Kodak concerning this...

Newsgroups: alt.cd-rom

*** The following is my opinion and not that of Eastman Kodak ***

First, I would like to take this opportunity to apologize for my previous
posting. (And no, no one is twisting my arm.) It was unprofessional and
unwarranted. Please understand that my colleagues and I have worked very
long and very hard on this project, and seeing the project slammed by
some people, whether informed or uninformed, has taken something of a toll.
Once again, my apologies.

Now, after discussing some other peoples' concerns regarding Photo CD, I would like to add as much information (and personal opinion) as I can. I hope that I can clear up as many issues as possible.

HOW DOES PHOTO CD WORK?

In a nut shell, 35mm film (negative, slide, B&W, internegative) is scanned by an image scanner and transfered to XA-formatted CD-ROM discs. These discs are manufactured by burning (writing) -- not by pressing.

Each scanned image on the disc is kept in five resolutions. These five resolutions are called: Base/16, Base/4, Base, 4Base, and 16Base. As examples, Base/16 is one sixteenth the resolution of the "Base" image, and 16Base is sixteen times the resolution of "Base". (These are not simply larger picture elements. There are in increased number of scan lines.)

The 4Base and 16Base images are are compressed using Huffman encoding. You need the decompression software to pull the higher resolutions out of the image. You would typically need these higher resolutions if you want enlargements or if you intend to use an HDTV as a display device.

WHY HAVE THE PHOTO CD FORMAT?

Some people have asked why Kodak would supply the community with another imaging standard. The two formats that people seem interested in are GIF and JPEG. Neither format can supply the kind of high-resolution imaging that is necessary for desktop publishing and other commercial uses. Those are important areas. Keep in mind that Kodak is not limiting its view to the home consumer market. There are other important market segments that can use this technology to their advantage.

One important distinction, besides sheer resolution, is depth of color. Photo CD support 24-bit images. My understanding is that GIF does not support that level. JPEG supports 24-bit, but it is lossy. The image must be lossless for it to be a viable format in some segments.

This project's prime purpose was to produce images that are superior to current standards and physical limitations. Kodak has achieved that goal with its Photo CD format.

I think that converting an image from Photo CD to an inferior format is counterproductive, and I think Kodak would agree. Kodak is looking at major market segments, and not the home hobbyist. If converting an image to GIF or JPEG is important, it may be more cost-effective to purchase a scanner (or have your images scanned by an imaging house). The whole reason for Photo CD was for a superior format -- converting an image to GIF, for example, would be like buying a $2000 stereo amplifier but using $50 home-shopping-network speakers.

Now, yes, an argument can be made because there is the capability of viewing Photo CDs on convention NTSC-based televisions. I think some of the reason for that is to have something in place until HDTV arrives. (Whenever that happens!)

--
*** The following is my opinion and not that of Eastman Kodak ***

However, once the image is permanently "downgraded" to GIF format, for example, it may be misrepresented as "Photo CD". If unauthorized third parties claim to have Photo CD to GIF utilities, they may very well be performing an inaccurate conversion because of lack of knowledge about the format. Users of those products may, however unlikely, label it a fault of the Photo CD format, when in fact it is not. Kodak must defend its Photo CD trademark.

In order to do this better, Kodak has chosen to implement a three-tiered scheme: a $39 viewer, a $695 development toolkit (for a currently limited number of platforms), or a source kit for $100,000. By defending their patent and trademark rights, a Photo CD consumer can be assured that something stamped with "Photo CD" will meet particular criteria. This is much the same as VHS -- when a consumer purchases a product with the "VHS" label, they know they are purchasing a piece of equipment that will be compatible with an other piece of VHS equipment. (Be it tape, recorder, or whatever.) If Kodak did not defend its claims, the consumer would be the loser. Cheap or shoddy products, while perhaps being weeded out of the market, would remain in the unfortuate consumer's mind before purchasing another Photo CD product. If you had purchased a 3-pack of VHS tapes -- only to find they did not work on your "VHS" deck, wouldn't you be upset? While educated computer hobbyists may understand that it was a poorly-written conversion utility caused the creation of a poor image, there are many others who can not or will not see that distinction. TIFF may be a good example of a format that was not kept in check.

Please remember, the whole premise of the Photo CD format is quality -- high quality. Kodak is not interested in seeing Photo CDs that do not have that high quality. Consumers will be interested in seeing that stamp of approval.

However, I do understand that it is great to see pictures of you and your family on your monitor, and to be able to edit them, and so forth. When I looked at the converted images (I admit, yes, that I used the posted PPM conversion tool), they were nowhere close to the original image's quality. Of course, I know what the original image should look like, so it may not be as striking to those who can not correctly view the Photo CD images.

I find it hard to believe that there is such a large demand to view Photo CD images in another format. Why bother? You gain none of the benefits that Photo CD has to offer; you just end up with disc and transfer costs. You are probably better off just scanning the images with a regular scanner.

THE TARGETED CUSTOMERS

I can't speak as well to this; I work on the PIW (photo-imaging workstation) -- this is the package that scans and burns the images to disc. I am guessing that Kodak's first aim is for desktop publishers. They tend to spend money for superior products, and there is very little competition in the price range that we are offering. Thus, the release of Photo Cd on the Mac and Windows platforms -- the two most common DTP interfaces. The

everyday consumer will probably have to slowly warm to the product, as people did with CDs and laser discs. Kodak does not apparently see the UNIX platform as achievable at this time -- it has other priorities and all companies have budgets. To affect a change in this, please register yourselves with the marketing group. If the marketing people do not see a need, they won't know to do it. Unfortunately, I don't know how to forward all of you to the marketing people. The 800 number?

*** The following is my opinion and not that of Eastman Kodak ***

SUPPORTED PLATFORMS

Currently, Photo CDs can be viewed on a Photo CD player, a CD-I player, and from CD-ROM on Macintosh and Windows platforms. Sun SPARC will also be a supported platform, but I don't know the timetable on that. The whole Photo CD project was developed on Sun workstations, in case you didn't know, which should facilitate making the toolkit (!). However, because of the greater commercial market in the Mac and Windows arenas, those were done first.

SUPPORTING SMALL BUSINESS

Judging by the response, there is a large segment of small businesses that would like to import Photo CD into their products. $695 is not an outrageous toolkit fee; in fact, I think it is very reasonable. This means, however, that we can only support two major platforms right now. I'm sure that Kodak would like to support all platforms, but it is as limited as the next company with budgets. I feel that we are going to fully support ever more platforms as Photo CD gorws and matures -- but we need time.

As far as SAS is concerned: personally, I think Kodak should be responding to your needs. It was mentioned by Jef Poskanzer that SAS distributes hundreds of thousands of copies of software -- I assume that SAS charges for this software? Spending the $100,000 to get the source kit to implement it on different platforms sounds like it would be in your interest as well as Kodak's. I don't understand what else you might like Kodak to do. Provide free source code? Many companies have already paid for licensing, including Polaroid, Sony, Philips, Pioneer, Apple, and Microsoft.

I don't think consumers should be asking Kodak to develop software for the dozens of platforms out there. Instead, they should contact their vendors and request that Photo CD be implemented into the operating system software, much like Apple has integrated Photo CD into QuickTime, etc. This would make a decent number of platforms available to users, have the vendors eating the major costs of development and support, instead of the small businesses or home users. By doing this, the companies can also hype their ability to read Photo CDs.

IN SUMMARY

Photo CD is a great product, and its time has come. With any revolutionary product, there are skeptics -- but if the product is good, it will outlive the skeptics (or better yet, convert them!). I think Kodak is doing the right thing. If you don't, please attempt to make your arguments clearly

and concisely to marketing.

-Jay

because I seem to have mixed this up with a news I once read in which somebody confessed he'd invented the whole thing to watch out for the reaction. Here I stand, getting more & more curious about what you can believe of the stuff that's posted here, but the above quoted seems to be true.

Frankly, I care if it's 24-bit color, which is what the industry refers to as "true-color". VGA is acceptable, but Atari shouldn't be making misleading claims. The 16-bit-color mode is the similar to the modes found on many VGA cards. The pictures may look incredible to you, but when digitizing pictures, it's going to make a difference.

> 19200 colours on a 320*200 screen (e.g. Photochrome) is POINTLESS - the

As for it being pointless, it's only so to you - you seem to have missed the point, in fact. When digitizing pictures and working with rendering programs, you need every possible shade...

Programmers don't invent resolutions, we just use the tools the engineers build. But I refuse to work on those not-so-fancy resolutions that you seem to enjoy so much (perhaps you should purchase an old Atari 8-bit, if you like not-so-fancy res's).

This clearly seems to be one of Atari's good moves, but I'm scared about the future support for "non-Atari" versions of MiNT, i.e. its existence.

I don't think the price is right. I've bought it myself for around DM 2-300.. It is surely a very good program, and you can make new funktions to it very easily. It is a GEM program and the frontend is programmed in Riemann itself!!

4848. art packages for a ST?

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 11:07:32 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Oct30.110732.5134@crc.ac.uk>
Source record: 215394

Can anyone recommend a decent art package for the ST?
I have tried Neochrome and it is basically crap...
Is there anything better?

I have seen a quick glimpse of Deluxe Paint III on a "friend's" Amiga, and
that looked quite good. Is there an equivalent for the good ole ST?

(I would like to print them from the program or save them in a format that
Timeworks 2 can handle.)

BTW Does anyone know about art packages being developed for the Falcon?
These should really kick some ass. (256 or even 65000 colours at once! Makes
the ST's 16 max look pretty useless, although I must say I have seen some
awesome pictures even in this mode)

Thanks for any help,
Phil
(E-mail naffara@uk.ac.crc)

Yqou can just use the dropdown menu, and load a resource like normal,
or, use ORCS system, which, when you open a drive icon, means you single click
on a resource file. This makes it "stick" to the m,mouse pointer, and you must
drop it on the desktop, like KResource. This is also how you add new parts
to a resource from the toolbox.

Hi folx!

I've uploaded a more up to date version of oscli to ftp.uni-kl.de
in incoming and to atari.archive.umich.edu in New.

The archive is named oscli10x.zoo. It includes the binaries, english
and german docs, man pages and some addtional files.

oscli is a neat command line interpreter with lots of features, e.g.
history, alias, XARG, mint support, batch files, remote control via
serial port, etc. See the docs and man pages for detail.

Have fun,
Larry

>Ah! Wow, Atari wins out there then - the populated boards might end up
>cheaper than the chips themselves perhaps!

This reminds me of the way the 2CV was imported to the US for some time. It wasn't allowed to be imported as a whole so they imported it as a do-it-yourself kit.

This is the exact opposite. If you need components a,b,c and d you simply order a custom board from Taiwan that contains the units, get a cheap price and knock the units off again to use them for your own projects...

If MacWeek said this, they're wrong. (This happens a lot with MacWeek, MacWorld, etc.... Why do publications have so much trouble getting the facts straight?) The CD300 absolutely supports multi-session Photo-CDs. Now. It's the older CD150 drive that only supports a single session.

> Yes and no. The cd-ROM drivers will be supportd by the new System7.1

> Apple CD-roms (and probably most 3rd party ones as well, but that is just
> speculation on my part). You will only be able to manipulate Photo-CD files
> by software that understands the format - it is not Pict or any of the common
> formats for Mac, so you will probably have to get a software update to
> manipulate Photo-CD files.

Sorry, but this is simply not the case. All you need is QuickTime 1.5 and the new CD-ROM driver software (version 4.01, I believe). System 7.1 is not required. (And these are all shipping now, by the way. There's no "will be" involved.) QuickTime makes Photo-CD files appear as PICT files to any Mac program in much the same way as it does with JPEG files. I.e., _any_ program which can access a PICT file can transparently access a Photo-CD or JPEG file. Most people concentrate on QuickTime's video playback capability, but this foreign file access transparency is one of the real advantages of QuickTime.

Next time, check your facts before you post. There's enough mis-information being circulated already.

- Dale Adams
Apple Computer, Inc.

4860. Atari archive is moving

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 15:06:21 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1crj1dINNgdj@terminator.rs.itd.umich.edu>
Source record: 215409

Well folks, as I foreshadowed a few weeks ago, atari.archive.umich.edu
has changed host machines. It is no longer located at terminator.cc.umich.edu.
Please continue to use the atari.archive.umich.edu alias for ftp and
you should experience no problem
Please inform me if you do though :).

[NOTE: AS of the time this was posted, the a.a alias had not been changed!
I hope to have that corrected this morning]

Here's an update about any changes/questions you might notice/have:

1. What about BART?
We're looking for a host to run bart from. The people who take
care of the new machine tell me that there won't be any problem.
This might take a day or two to switch over, so be patient.

2. The atari.archive.umich.edu alias never worked for me. What is the
new hosts address/ip#?
Actually, there are two hosts running for the archive now. The first
is carpediem.ccs.itd.umich.edu; it's ip# is 141.211.182.23. The other
machine is shavenyak.css.itd.umich.edu and it's ip# is 141.211.165.41.

3. The other archives at umich are on afs. What about atari?
Yep, atari is now also. You can get to it by

cd /afs/umich.edu/group/itd/archive/atari

Please do this in one cd, as some of the directories are
protected in between.

4. Jeff, you've been slacking on archive work since you started grad school.
Can't you try to find someone to help?
Funny you should ask...I'd like to welcome the newest members of
the umich atari posse, David Paschell-Zimbel, entropy, Mike Mast,
and Michel Forget. May you four go forth with as much sarcasm as
your archiving forefathers. It is with great hope that their
involvement will speed the upload to newitems time.

Also:

There was probably a lot of stuff that got nuked in the move, either
intentionally or not. Please let me know if you come across anything.

It is a well know fact that symbloic links don't ftp well. If you
come across some that should be there and aren't, please let me know.

Cheers,
--

:^)
Yes, I believe SCSI2 is backwards compatible. Your old drives will work,
but you'll need a new cable (50 pin Honda -> 50 pin Centronics).

4864. Floptical experiences (75 lines)

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 15:30:51 UTC
From: DKoppen@air31.larc.nasa.gov
Message-ID: <DKoppen.19@air31.larc.nasa.gov>
Source record: 215414

I have gotten _lots_ of good information from Usenet, and now perhaps, I can contribute some back. :) I certainlly hope this topic is of interest to _some_ Atarians, it was to me. Anyway...

At the last WAACE show (October 10-11), the Joppa booth was demostrating a floptical disk drive for the Atari series of computers. A floptical drive reads, writes, and formats both double density and high density 3.5 inch floppy disks resulting in 730 Kbytes and 1.44 Mbytes respectively. In addition, if you buy a _special_ 21 Mbyte floptical disk for about 25 dollars, you can read, write, and format a 3.5 inch disk that has a 21 Mbyte capacity. The setup shown had a cable running from the back of the Atari STe to a ICD Link. The other end of the Link plugged into the back of the floptical drive. During the show I watched while one of the technical staff (I believe it was the store owner himself) booted the machine, formated a double density 3.5 floppy, wrote a file to it from the internal floppy, popped both floppies out, exchanged them, and read and wrote files both ways. This demostrated to me that the formats were interchangable and that floppies formated in the floptical were 'Atari compatible'. He then popped a _special_ floppy into the floptical, formatted it, and wrote several Mbytes of data to it. I WAS IMPRESSED. I also bought one. However, since I already owned a FaST drive which has a ICD AdSCSI interface inside, I did _not_ buy the ICD Link (an additional 100 dollars). As a condition of the sale however, I did require that Joppa provide me with the current ICD device drivers. I had been using 5.4.x with my FaST drive, and I noticed that Joppa was using 6.0.2. I assumed the newer version included the information needed to run the floptical. This was not altogether true.

I brought it home, hooked it all up, and just for kicks, tried the 5.4.x drivers that were already installed. Not suprisingly, the new floptical drive was not even seen. I loaded in the 6.0.2 version of ICDBOOT.SYS and the new drive was recognized. I thought I was home free. I created a new drive icon, but each time I double clicked on it, I got a 'drive nonexistent' message. ARGH. I called PLI, the manufacturer of the drive. They said the drive sounded OK to them, but the drivers I had may be defective. This sounded like a run around to me, but I called ICD to check. After describing the situation to them, I was much surprised to find out that ICD was due to release the new device drivers within the week and they would cost 50 dollars. At that point, I wondered what Joppa had sold me, unreleased drivers?? However, Joppa has been very good to me and rather than pursue that subject and risk getting Joppa into trouble, I pre-ordered the new drivers.

Just for grins, I brought the floptical into work and attached it to every IBM PC compatible with a SCSI interface I could find. This included such brand name cards as Always Technology and Adaptec. None of them worked. They all saw the drive, but could do nothing with it. Once again, I called PLI and once again they insisted there was nothing wrong with the drive. Double

ARGH. Then I tried it on a MacIntosh IIcx...
It worked perfectly! In fact, the 21 Mbyte disk that came with the drive, had MacIntosh system files on it. This was _really_ weird because all the documentation that came with the drive refered to connecting it to an IBM PC. I took the drive back home, and tried everything, including downloading ICD's version 6.0.4 driver from Genie (Thank-you Usenet for telling me where to find it :)). Even with the 6.0.4 driver, the drive could be seen but not used.
Then it occured to me, if the format of the drive was MacIntosh, I needed to reformat the disk before it could be used. Happy again, and convinced my head was made of wood, sometimes, I tried to format with version 6.0.1 of ICDFMT.PRG. I got an error $04. What the heck did that mean?? I was resolved that my drive was defective and that I had to wait until ICD released it's new drivers before I could call PLI once again. The following night, the ICD drivers showed up on my doorstep.
ICDBOOT.SYS was version 6.0.4, which I had already (via Genie), so with out much hope I tried ICDFMT.PRG. With some interest I noticed this had been upgraded to version 6.0.2. SURPRISE AND JOY OVERWELLING.. It worked. The drive formatted and partitioned with no problems. For the rest of the evening I formatted, wrote and read disks to my hearts content.
It cost me 50 dollars and a bit of trouble, but such is the way with new technologies. I also should apologize to PLI, they were right, the drive was fine. The moral to this story:
The floptical disk drives work with ICD's AdSCSI, but only if you have the most recently released drivers. Version 6.0.4 of ICDBOOT.SYS and version 6.0.2 of ICDFMT.PRG. :) :) :) :) :) :) :) :)
Thanks for reading this, I hope it was of interest to you.

SRU> grey-scale images, but two bits of brightness resolution should not make
SRU> much difference at all.

Most people agree that you don't need more than 24 bits, because the human
eye cannot see more differences in color. 16 bit might be enough for a lot
of purposes (even 8 bit is enough for many applications), but if you
compare a 24 bit picture with the same picture in 16 bit you can clearly
see the difference if the picture contains continuous changes in color
shades (unless you are more or less color-blind). The 16 bit image will
reveal color change edges.

Yes, SCSI-II is backwards compatible. The only thing you'll need to do to your existing drive setup in order to be able to use it with a Falcon030 is to change your connections and get a SCSI cable. With the Falcon's built in SCSI, you won't need your ACSI-to-SCSI host adapter. So probably the only things necessary to do are:

Get a SCSI cable (mini-50 on one end, standard SCSI on other).
Replace the host adapter with just a 50 ribbon cable between the drive and the drive case, and get a SCSI connector to mount on your drive case.
Attach SCSI cable to SCSI port on Falcon and SCSI connector on drive.
Power up!

I will probably get a new case for my hard drive. Since all you now need is a case, power supply, and SCSI connections, the case will be relatively cheap, since you could get one of the thousands already available for Macintosh, NeXT, etc.

What do you mean? MiNT changes gradually but that doesn't really have to do
with the fact that it is now part of MultiTOS. E.g. the fact that drives V and
X are going to be abandoned was to be expected, etc.

4870. Elvis 1.6Beta2 & Mint & Minix & Gemini

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 16:56:22 UTC
From: malay@sae.com
Message-ID: <1992Oct30.165622.10045@sae.com>
Source record: 215423

Something strange has been happening - I'm running Gemini/Mint 0.95/MINIX_XFS - if I open up the console window and "cd" to a TOS directory and "elvis" some file then elvis runs normally - if I "cd" to a MINIX partition and "elvis" some file then "elvis" spits out the message "Unknown Terminal Type" and closes down.

If I just run MINIT/MINIX_XFS/TOSWIN and "cd" to a MINIX partition and "elvis" some file then "elvis" runs normally.

It appears that Gemini has a problem with MINIX partitions and Elvis 1.6Beta2 - I didn't have this problem with "elvis 1.4" but "elvis 1.4" doesn't work with Mint/Toswin.

That, of course, depends on the picture. If the pictures displays a lot of
widely different colours, okay. But for a tone-in-tone (translated from German)
picture of say, a _nature_ scene *blush* with lots of different pinks & such,
256 colours can go a long way.

Well Sozobon may have more bugs than a termite mound but this ain't one of them. Word & long word adds (adda or addq) to an index register both do 32 bit arithmatic on the destination. The only difference is the size of the source; and nobody in their right mind should push >32k of arguments on the stack (stack frames on the 68000 are limited to 32k and anyway max stack size is fixed at compile time and is usually considerably less).

The question if a 60 Hz monitor is a strain on the eyes or not is irrelevant.
It makes a BIG difference if you are looking at a color monitor or at a
B&W one. B&W can be quite easy on the eyes if you use long-persistence screens
and a sufficient number of pixels at a Hz rate where you would ran screaming
from a color monitor after 15 minutes.

Source record: 215420
Cross-posted to: misc.forsale,kw.forsale,uw.forsale,comp.sys.atari.st,rec.music.synth

I have the following for sale:

SM124 mono monitor
SM125 mono monitor
SM1224 colour monitor

1040ST w/ DS drive, mouse, etc.
1040ST w/ DS drive, mouse, etc.
520STfm w/ SS drive, 1Meg upgrade, external DS drive, mouse, etc.

Atari 20M hard drive

I want to sell systems out of this lot. So, pick a computer and a monitor
and its yours for $450 CDN, with a colour monitor a system will be $500CDN.
Add $225CDN for the hard disk. These system will come with a bundle of useful
software including a reasonably good MIDI sequencer.

Brett Maraldo

Can someone "in the know" tell me why Atari didn't keep the MEGA ST case design and use it for all their other computers (STe/TT/Falcon)? It's more professional looking than the 1040ST case, and it allows a exact case (MEGAFILE) duplicate to ride beneath it. Why o why did they loose such a good thing?

Reply in Email please to: jared@midiline.la.ca.us

4878. Is there any Atari support..!!!

Newsgroup: comp.sys.atari.st
Date: 1992-10-30 22:20:48 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1cscg0INNl2q@golem.wcc.govt.nz>
Source record: 215424

This refers to some phone contacts with PARAGON Computer's
in Perth Western Australia...

This is the bigest distributer of Atari Computers in OZZ..

I contacted them back in May/June about getting TOS 2.06,
they informed me that they were getting some from Atari OZZ soon.

I contacted them again on Monday the 26th Oct 92...

A friend would like his Mega STE upgraded to TOS 2.06 and a 1.4 meg drive..

I have heared that there are kits for this in the USA...

Well Paragon stated that there was a 2 year waiting list for 1.4 meg drives,
or some thing to that effect, I then asked about TOS 2.06, he stated that
Atari OZZ had let them down and they were hoping to get some from Compo U.K.

I also asked about the replacment GAL chip, and the chap stated what GAL chip !,
never heared any thing about a new GAL..??

I also aked if it was true that we were getting a Demo Falcon here in NZ. in
November, he stated that this was very unlikely and it would be
about February 93, before we saw Falcons out here, OZZ/NZ...

NOTE: Bob Brodie the Communication Director for Atari USA, stated to me
that If I needed Atari support here in New Zealand that I should go
to Atari OZZ or PARAGON Computer's...

I have allready delt with Atari OZZ and it took 12 Toll calls to get
replacment DMA chips, also there Service manager did not know what TOS 2.06
Roms were...???

Tell me is this Support..???

So tell me chaps do you think that people should stick to Atari, if you do you
must nead your head seeing to...

>Can anyone recommend a decent art package for the ST?
>I have tried Neochrome and it is basically crap...
>Is there anything better?

If you want a serious and well-supported graphics package, I'd suggest
looking into the "Phase-4" series offered by Lexicor. This includes
Prism Paint, a full-featured drawing (and bits of animation, too I think),
Chronos 3D, a really really cool 3-d animation program, Prism Render, and
some other stuff I don't remember offhand...

Anyway, the best thing about the Lexicor software is that it takes
advantage of whatever hardware you happen to have. For example, you
just bought a $800 Crazy Dots adapter but were disappointed because you
didn't have any 256 color software. Well, Prism Paint will detect the
graphics card/TT/Falcon/whatever and use the best possible resolution and
#colors it can get (like I said in a previous message, any GEM program
is capable of this).

>
>I have seen a quick glimpse of Deluxe Paint III on a "friend's" Amiga, and
>that looked quite good. Is there an equivalent for the good ole ST?
>
>(I would like to print them from the program or save them in a format that
>Timeworks 2 can handle.)

I don't think this should be a problem, I believe Prism Paint supports a
wide variety of graphics formats.

>
>BTW Does anyone know about art packages being developed for the Falcon?
>These should really kick some ass. (256 or even 65000 colours at once! Makes
>the ST's 16 max look pretty useless, although I must say I have seen some
>*awesome* pictures even in this mode)

See the discussion above. Lexicor Software currently should run on a
Falcon(and use the new video modes), although it is also the case that
Lexicor is working on lots of new Falcon-specific software which will
be even better yet... :)

>
>Thanks for any help,
>Phil
>(E-mail naffara@uk.ac.crc)
>
>--

>Kryten (When Cat says why don't we raise the defensive shields?) "A superlative
>suggestion sir,with only two drawbacks: one,we don't have any defensive shields
>and two,we don't have any defensive shields.I know that,technically,that's only
>one drawback,but it was such a big one I thought I'd mention it twice".

BTW, Prism Paint sells for around $60 or so last time I checked.

>must nead your head seeing to...
>

Roger, I'm sorry the situation is so bad over there, but you really can't generalize this for the entire world. Support in Europe is still good and in the U.S. there are a lot of really good people working to support Atari users everywhere. Sure, we don't have nearly as many Atari dealers as we used to in the U.S., and it does seem like MS-DOS is destined to take over the world, but don't forget that just because few people have Ataris doesn't mean they are a bad computer to have. Some might argue the contrary, as a matter of fact. At any rate, there are numerous large mail order companies and dealers who are *growing* selling Atari products. Now, I know you're going to say "well, that's because all the dealers are gone," and you may be right. The fact is that the Atari is an excellent platform for all sorts of things, and those of us who know that can live with the small amount of shove-it-down-your-throat MS-DOS type support.

Personally, I've gotten a lot of support and good ideas from this group and the internet, and I've dealt with a lot of friendly and smart people working with Atari computers. It's too bad more people can't have access to it, although more and more people are using telecommunications on their computer nowadays. Of course there's Genie and CompuServe too, excellent places to go if you're having problems or just want some more information. I guess my point is that it's not as bad as you make it out to be, especially not in Europe or the U.S. I'm looking at the Falcon030 as my next computer for quite some time, unless I win the lottery and can afford that Cray II to do my word-processing on... :-)

4887. "Art & Film Director" Animation Problems

Newsgroup: comp.sys.atari.st
Date: 1992-10-31 01:46:58 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1992Oct31.014658.23033@news.arc.nasa.gov>
Source record: 215433

My brother is having trouble getting his newly-purchased "Art & Film Director" animation software to get past the title page on his STe (TOS 1.6, I think). The indications seem to be that this old program has not been upgraded to newer (> 1.0 ?) TOS versions, except for the fact that when trying the same copy of the program out in all the Ataris in the retail store he bought it from, it works fine. Does anyone have experience with this package, and know if it has problems with TOS versions > 1.0? Incid

entally, he's running with no accessories or auto-boot programs. Any recommendations for other commercial or public domain animation programs?

Thanks.

- Glenn

>> from Atari. I told him I had no idea, but I'd ask here.
>Please respond in the base here E-mail me also....I am interested in the same.

Well, I replied to the original poster, but it bounced. Since others are
interested, here's what I wrote:

The definitive answer is that Atari doesn't give individual student discounts.
If you want to buy several for a classroom or a group of students, they can
arrange a discount I think.

But they don't give discounts like Apple and IBM give discounts.

If you want to wait a year after the Falcon comes out, I'm sure it'll be down
to $399 for the one-meg version.

Message-ID: <1992Oct31.041350.16208@pasteur.Berkeley.EDU>
Source record: 215438

I was interested to know if anyone has seen the demo of SF_II for the Atari. I've heard that Capcom has licensed U.S. Gold to do a conversion for the IBM, Atari, and Amiga. Someone on another newsgroup said that the IBM version was well done with SVGA, while the Atari and Amiga version had only 16 colors so that the port between the two would be easy. He said that he had all the demos, but I could not contact him for anymore info. The IBM and Amiga demos are floating around, but where is the Atari ST demo? I'd really like to see this, and also know how the controls will be. I've heard that it'll have a joystick and keyboard combination, is this so? Can you just imagine if this thing was created for the Falcon030? The graphics would be spectacular and with the analog joystick ports that support joysticks with up to 10 fire buttons, gameplay could be reproduced amazingly well. This would draw lots of attention to the new line of Atari Computers. I can dream, can't I? Later.

To : All
Subj: ATARI's future

Dear ATARI users,

I am sure you are aware that I am no longer working at ATARI Corp.
Different personal and inner company reasons made me do this, not so easy
a step.

I understand the current German ATARI market is categorized as one of
the strongest markets anywhere, and I am sure that makes it hard to
understand why I left. I appreciate your feelings deeply. My decision to
leave ATARI was strengthened as a result of it being decided to stop
FALCON production because people noticed that the planned customers
weren't ready to invest between 2300 and 3500 German Marks ($1300 and
$2000). These persons would most likely buy a MS DOS compatible computer
or even a Macintosh instead of putting a low end machine with very limited
uses in their house. At this time however, a few FALCONS are being
delivered to a few select, handpicked German dealers, these belong to the
first production run and are without, as announced, MultiTOS. Instead,
they are being delivered with the single tasking TOS 4.0x. The number of
machines are limited and will be the only ones available for the time
being. You most likely will not understand this unusual strategy, but why
should we produce thousands upon thousands of FALCONS that can't be sold?

The FSM-GDOS and MultiTOS production had to be stopped in the last
minute because 1) a renegotiation with Mr. Eric Smith (copywrite) and 2)
differences between ATARI and Bitstream. Naturally ATARI knows that
MultiTOS, for the entire semiprofessional area, shouldn't be
underestimated and that the MT project will be taken up again.

The SUTRA project is still under high pressure development and should come out around the first of April 1993.

The entire ATARI product line is still going to be 'fully supported' as much as possible, although the 68030 class of computers will have to be held back until it is believed they have a fairly good chance in the market. At this time, the need for powerful machines seems to be satisfied by the TT and ATARI is having it hard enough as it is. I hope I was able to give you a small picture into ATARI's future and I beg of you not to doubt in ATARI's credibility. Think positive!

I wish you all much luck

With friendly grusses

Alwin Stumpf
(former General Manager, ATARI Germany)

Can some one back this up..???

This was cut from STR843.....

falcon here is his setup
For sale, CHEAP!

Hardware:
Atari 520ST with 4 Megabytes (includes RF to connect to TV)
Atari Mouse, of course
NEC double sided floppy drive (cable and power supply)
Avatex 2400 modem, with RS-232 Cable
OkiMate 20 (24 pin) color printer, with plug 'n' print and cable.
(with extra print-head, 100,000 character life)

Software:
WordUp 3.0
1st-Word
Tons of PD and Shareware programs on double sided floppy
ANSITerm 1.5b, DigiPlay Plus 1.5, ACC Manager
(pre-registered in your name; be sure to mention this)
STOS
Language Disk
Games Disk
Accessories Disk
Compiler
DEGAS (No manual)

Games (with manual and maybe box):
Star Trek The Rebel Universe (Both manuals)
Star Gchael Jackson Moonwalker (2 disks)
Millennium 2.2 (2 disks)
Deep Space (2 disks)
Eight Ball
Airball Construction Set
Time Bandit
Pinball Factory
Chaos Strikes Back

Books:
Atari ST Tricks & Tips
Atari ST Peeks & Pokes
Atari ST Graphics & Sound
Atari ST Machine Language

All for $690.00 (shipping not included)

Well, a few days ago Eric Smith came on and said that the rumours floating
around about MultiTOS were false, and I would be inclined to believe him,
since he's the one supposedly embroiled in the "renegotiation." :-) He
said that Atari had the complete rights to using MiNT for MultiTOS and
that any hold up or problems were not between him and Atari (remember,
the same post where he said he was going to work for Atari... :)

I hope this isn't true about Falcon production being stopped, as I
sure want to buy one! :/

Thanks... I couldn't recall what format they stored it in (it's been since January, after all). However, a couple of friends with NeXTs have PhotoCD->NeXT picture format converters already, and assuming no one else bothers, I'll probably do the conversion for the Falcon when I get one... I don't see much reason to make an ST/STe viewer (but I'll make it work on it, I guess - why not?)

Got a Mega 4 ST. Wish it was a Mega STe? :-| Do I *really* want a Falcon/Next?

4906. FOR SALE: Atari 1040STf, Megafile 30, SC1224, and Modem

Newsgroup: comp.sys.atari.st
Date: 1992-10-31 18:10:02 UTC
From: tad@ritcsh.csh.rit.edu
Message-ID: <1992Oct31.181002.29235@ultb.isc.rit.edu>
Source record: 215465
Cross-posted to: comp.sys.atari.st,misc.forsale.computers,ny.forsale

```
FOR SALE
--------

Atari 1040STf - With homebrew detached keyboard
the case is painted flat black, and looks nice (spray paint
with "plasticoat" plastic spray coating.)
( will put keyboard back in case if you so desire )

Megafile 30 HD - Loaded with PD software including sozobon C 2.0 and
ana-modula-2 (both from atari.archive.umich.edu) so you
don't have to install em. Also, HDX 3.01 installed,
5.01 on the drive (never got around to installing it)
will ship as is, or will reformat to whatever partitioning
you want.

SC1224 Color Monitor - Great condition, its one of the original JVC ones with
the push on switch on the front (much better
quality than the goldstar ones, they pretty
much suck) Nice bright screen, no burn, etc)

Everex EverCom 24E - 2400 BPS modem, MNP 4-1 Error Correction (MNP 5
is the compression one) Works great, never gave
me any problems, built in speaker phone with
mute button, "online help (at&h)". I'll throw
in my approx 10ft rs-232 cable for it.

Homebrew Joystick - You gotta see it to believe it. Free to whoever
purchases something and wants it.

Minix - V1 - upgradable to the current version by grabbing
the patches from the ftp sites. I never bothered,
bought it from someone on the net then never installed it.

All the cables and whatnot needed to plug and go are included.
I have some docs, like the book for the hard drive, and maybe the
books for the computer. I have the original padded box for the hard drive,
but no real boxes for the rest.

I'm looking for BEST OFFER on any of this stuff. Its cluttering up
my dorm room now that I have a real networked workstation on my
desk. Buyer pays shipping

If you have any questions, feel free to email, or call:
(716) 475-3995 - Ask for Tad, or leave a message on the
machine and I'll return your call.
```

This is precisely the rumor that I was trying to squelch earlier. I'll say it again: I have been party to no renegotiations with Atari. Nor are any renegotiations necessary; Atari has for some time had a proper license to use MiNT.

I don't know if the message purporting to be from Mr. Stumpf is a forgery or not, but it's entirely possible that it was. At any rate, I'm rather suspicious of the other information presented, since I know that the part involving me is incorrect.

The above are my opinions only, and do not (necessarily) reflect the views of Atari.

In <1992Oct31.014658.23033@news.arc.nasa.gov> glennd@pioneer.arc.nasa.gov (Glen Deardorff) writes:

>My brother is having trouble getting his newly-purchased "Art & Film Director" animation software to get past the title page on his STe (TOS 1.6, I think). The indications seem to be that this old program has not been upgraded to newer (> 1.0 ?) TOS versions, except for the fact that when trying the same copy of the program out in all the Ataris in the retail store he bought it from, it works fine. Does anyone have experience with this package, and know if it has problems with TOS versions > 1.0?

Firsrt, you might want to ask whoever administers your site to supply an editor that puts in hard carriage returns when osting as not all newsreaders rewrap the words.

I remember in the dim past hearing that Art and Film director needed to have nothing below them in memory, and that Topdown worked to fix this.
However, with a tos 2.n machine, with Tos itself taking up extra low memory you may be beat running these programs. Also, if they do any direct memory calls, you're alos beat because the memory map was moved up after tos 1.4.

Wait a second. I've been able to get it working on my TT (TOS 3.06).
Load it into high resolution (TT med may work) and be sure that the cache
is off. I know I got it to work 'cause I did it just a few days ago.

(1) {Flame on} Maple has had a few more years of development under its
belt, and is mathematically more stable. People have had an easier time
crashing Mathematica than Maple. There have been two reviews of "Math
Software" in that bastion of Journalistic Integrity, PC Magazine. Both
reviews have found Maple to be better. (I'm UW alumni, and thus may
have an axe to grind. PC Mag, on the other hand, doesn't care from THAT
perspective.)

Mathematica definitely has more "flash", and gets thrown in "free" with
every NeXT computer. However, it doesn't have the maturity of Maple.

{Flame off}

(2) Without exiting rn, you can get in touch with the "relevant people."
Subscribe to "sci.math.symbolic". People from Maple Systems Software,
notably Keith Geddes, one of the primary authors of Maple, frequents
the group, and can direct you to the appropriate e-mail address at which
you can get ordering information.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <68686@cup.portal.com>
Source record: 215474

This sure has been an interesting discussion..

It appears that democracy has finally reached the hallowed halls
of science..

Now we get to VOTE on what the terms mean..!

I vote we call the Falcon a "Supercomputer" like the CRAY-1.. after
all, if we can "vote" that it has True Color, why not..?

Also, it's interesting that computing terms now depend on personal
need, ie, the Falcon both DOES and DOES NOT have TRUE COLOR, depending
on your needs. OK.. I *need* a 1.2 Gigabyte hard drive.. does that
mean my 20 Meg drive is suddenly measured in Gigs..?

Anyway.. yer ALL wrong...

It doesn't matter that True Color is defined by most of the industry
in one way, or what graphics users in most of th computing industry
understand the term to mean..

The Falcon has "True Color" because Leonard Tramiel SAYS it does..!

End of discussion...

John Richardson asked about modems connected to joystick ports..

The MPP (*not* Atari) 1000E modem was for the *8-bit* Atari computers which did not come with a serial port. The software used the joystick ports to communicate with the modem at 300 baud.

You **DO NOT** want this modem..!

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1cvc4jlNN2a5@golem.wcc.govt.nz>
Source record: 215476

Myy Chaos is running fine without the boot-sector. (I used 'Chasseur II' and converted the boot into a file). I also renamed the 2 AUTO files, so even after packing, they will extract and execute in the correct order!

My boot-sector of Chaose now has an Immunised-Boot sector on it! (I got hit by a virus the other day from smeg knows where).

works 100% - and when LZH'd, knocks over 100k of the total of the 2 MSA'd files!!

How to UN-MSA chaos:]

Get Magic Shadow v1.41, or if you have an ST (not E) you can also use 'Chaos Disk Compactor' (CDC is available in the arc directory on atari.archive.umich.edu) and will allow disk-swapping when un-MSAing a file.

Create a 650k RAM-DIsk. (or more if yuo can afford the RAM.)

Copy the MSA program, and one of the CHAOS*.MSA files into the ram-disk.

run MSA from the RAM-Disk. Select the Chaos file FROM the RAM-Disk.

Select the destination disk, and insert a blank formatted 11-sector per track, 82-track, 2-sides disk. (Must be pre-formatted with F-Copy or some such program that'll format 11-sectors).

With the source file being in the RAM-Disk, and the blank dest' disk in drive A (or B if you have one, in which case use that). hit GO, and wait!

Once finished, exit to desktop, delete the CHAOS*.MSA file from the RAM-DISK and copy the other one, then repeat the procedure for the other half of the disk!

If you have a Hard-Drive, use that instead of the RAM-DIsk.

If you have more than 1meg of ram - you can create a 1-meg RAM-Disk, and copy BOTH CHAOS*.MSA files and the Magic-Shadow program into it!

4916. Rawfiles.zip

I went into my dealer today... (the one about 15 miles from ATari USA)
and asked "any falcons yet"
the guys said: they haven't been released.
i blinked a few times, and replied: but i its the end of october.. thats the
realses dat isn't it?
dealer: well maybe next year.

This is not a gripe or flame. i'm an atari loyalist.
but whats going on?? Was there *really* an official report sayuing
"we at arti will release the US falcons at the begiinning of november"

i tought there was.. ah well... whats the new word then? (was there a
first word?)

i was hoping that since there are 4 dealers in the bay area here, i was
hoping to see something. :(

oh yah... Bob Brodie said on Atari Base USA. (fnet i think) that atari
and kodak are 'still talking' regarding photoCD.
about alt.fnet.znet.. i got messages from it once. but nothing new has
shown up.

>Timothy "almost a developer" Wilson

I talked to Atari on the phone a week or so ago, I asked when the Falcons
would be available in the US. The reply I got was "This is just a Guestimate
but I would say three months from now".

I got the impression that a) They wanted to wait until they had a
semi-respectable number or falcon specific software available, and
b) they wanted to wait until they had a larger quantity produced.

If this is really the case, I can't say I blame them, even though It
makes us wait a few more months, it will greatly improve falcon sales.

Remember when the ST first came out and you COULD NOT find a double
sided external drive for sale anywhere? Lynx sales were poor at first
because of lack of software, even though it's vastly superiour to the
other portable game systems. That really pissed off some users
and dealers, and I would hate to see that happen to the falcon.

But I know for a fact that my floppy drive WILL NOT format more than 10 sectors. That is the only reason why I have not downloaded Chaos. If there was a version out there split into 2 separate archives, suitable for HD use, I would get it.
So, can anyone oblige?

The only problem with putting an internal hard drive in a mega is
that it's tricky to get am external wotrking with it. Or it used to be
when the Supra's came out. I've also heard the same thing about the
ICD mini host adaapter. I think you'd have to shoehorn in a full host
adapter and rewire the dma out to be a scsi out.

4928. Chaos

Newsgroup: comp.sys.atari.st
Date: 1992-11-01 22:33:30 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Nov1.223330.25907@cs.nott.ac.uk>
Source record: 215487

I have no objections to someone uploading a German keyboard patch for Chaos, after all, it is PD!

I have also seen some mails to this newsgroup suggesting that CHaos is shareware; this is not so, Chaos is PD, since it is simply an unauthorised conversion of a very old Spectrum game.
As for people who don't like it; Where's your taste??

If anybody wants an arc of the main game file so they can stick it on the HD, then just email me and I'll send you one ASAP.. The file will also work from floppy (got to be in AUTO for 1meg peeps, tho). Beware; it'll be about 700K and I'll send it in two files... Make sure you have the quota, or ask me to mail it on two different days.....

Martin

The following message should be of interest to GFA Basic enthusiasts. It was posted to my local club BBS a couple of days ago.

****

Technical/Programing / NeST GFA BASIC, #39 of 47
Date: 10 Oct 92 21:59:08
From: Peter Kocourek of 90:4001/0.17
To: All
Subj: News from Richter; GFA 4.0

Hi everybody!

On Saturday, the third of October, a meeting of GFA-programmers was held with experienced users in Germany, where the future development of GFA Basic was thrashed out. It was specifically intended that the views of "real world" GFA programmers be taken into account. The following information I take from a message in the German GFABASIC.GER echo, by Lars-Thorsten Sudmann, who is connected to the firm Richter, which has taken over the development of the ST version of GFA Basic. The "real" GFA company will no longer be involved with the ST.

The new reprogrammed GFA Basic, currently under the name "4.0", will have a small compiler, which can create stand-alone applications quickly. For more experienced programmers, there will be a GFA to C converter, the code of which can then be used by many C compilers, on many computer systems. Named were MS-DOS, Windows and Unix.

The management of variables will be changed, so that the problems caused by garbage collections moving variables around will be obviated. All commands in the new version will be based on "clean" OS calls, and the dirty low-level stuff that plagues GFA Basic now will be abolished. Downward compatibility will be maintained, including the Line A calls; however, these will be redirected to the proper VDI routines. The new documentation will contain programming advice and guidelines for GEM.

Old versions of GFA Basic used to gobble up all available memory. This will be changed, so that programs will only allocate the minimum necessary. Requests for more memory will in some cases be made by GFA transparantly, while the OS Malloc-functions will be available too.

The new version will also support modular programming; you can split up your source code into smaller parts, just like in C or Modula-2, greatly enhancing the readability and maintainance of the code. C-like structures are also planned, but may not be included in the first new version. Function libraries will be available too, and useable from the interpreter.

The file functions will now allow the usage of real GEMDOS filehandles, and errorcodes, removing the cumbersome old way of doing things.

The editor will be rewritten completely. The new editor will at last be fully GEM, and it allows multiple source codes to be edited simultaneously. It will also feature on-line help, and a multitude of options, so that its behavior can be fine-tuned to the wishes of the programmer. Keyboard shortcuts will in large part be the same as in older versions; shift F10 will still be "Run."

The programming team intends to work as quickly as possible; while obviously no firm date can be given at this time, Richter hopes to be able to make further announcements about the progress before the end of the year.

Suggestions, bug reports and ideas can be sent to Ulf Dunkel % MAUS OS, Fido 2:242/2.6. He is also in charge of writing the documentation for GFA 4.0.

All that remains for me is to mention the address of Richter:

Richter Distributor,
Hagenerstrasse 65,
5820 Gevelsberg,
Germany.

It looks like the directories are back at atari.archive, but atari.archive
is not where it used to be, it's a different server.

One thing I noticed: The files didn't retain their date and time, so you'll
have difficulty in identifying new files.

bye, Bart (CU ;-)

>but whats going on?? Was there *really* an official report sayuing
>"we at arti will release the US falcons at the begiinning of november"

(Stuff deleted)

>--
>Timothy Wilson <wilsont@rahul.net>

A good friend of mine who happens to work for the local atari dealer said
that the last word he had from atari, about a week ago, was that there will
be Falcons in the US in "the first part of november". I'm assuming this
means within the next two weeks. I'm still hopefull that they will be out
then. The dealership is supposed to be getting two, yes only two falcons, in
the first batch, and both are labeled as 'demonstration units'. One of those
is probably mine(grin). If I don't have a falcon in two weeks, THEN I'll
start to bitch.

4938. Re: word on US falcons???

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 04:23:23 UTC
From: saj@chinet.chi.il.us
Message-ID: <Bx2Mv0.Ku9@chinet.chi.il.us>
Source record: 215496

The announcement that there would be Falcons in the US as soon as FCC approval could be obtained, and probably in mid-October came directly from Sam Tramiel. One of the more important things to learn in dealing with US corporations is that the president is never an official spokesman for the company. Basically, anything the president says is a wish, not a commitment. To the best of my knowledge, the only official spokesman for Atari in public discussions is Bob Brodie. I believe Bill Rehbock also speaks for Atari in developer relations. It doesn't count that Bob Brodie appears to have done the typing when S. Tramiel made the announcement.

Still, it would sure be nice if SOMEBODY got a Falcon retail pretty soon.

Steve saj@chinet.chi.il.us

4939. Re: The Falcon Does NOT have True Colour

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 05:03:39 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1d2crbINN438@golem.wcc.govt.nz>
Source record: 215495

No computer can possible show 'true' colour any-way, so the term is stupid.

Real colour has an infinite 'palette'. Albeit the human eye cannot distinguish them all. But, some people cannot see the lighter colours, some cannot see the darker colours - and many in between. TV-screens/monitors are completely incapable of displaying 'true' colour anyway - due to the distortion of distant magnetic waves (coming from the computer or the monitor itself) - the picture just *cannot* be 'true' colour displaying!

Besides - as with sound, there are 'sub-conscious' colours, with sound, the sounds that cannot really be 'heard' (the ones above CD's cut-out range of 41.7Khz or whatever it is was causing some controversy because of complaints that it wasn't as 'soothing' etc.). Subtle shades of colours which is not the colour itself, but rather the 'coloured feel' in produces, cannot possible be re-produced by any means, and certainly not by 32-bit computer systems!!

Someone get a 24-bit photo, and then have a look at the original scene or some such thing - it's just not the same!

4940. Overscan address in German?

Mick_Schmidt@hb.maus.de

> Sorry, I don't tend to read very far into docs when I can't read the
>language. I sent Tom the resource file though, and now I've got the
>new ger2en21.prg, I'll see if I can read a bit of the docs.

Yea, that's the problem why we didn't put the program to a.a ourselves.
We thought it wouldn't be very useful without any english docs and we had
no time to do an english documentation, the german manual already took more
time than we thought. But it's seems that it would have been enough to make
an english .rsc and a readme.txt, i guess. ;-)

Well, the next version will probably have both of that and if there are
questions they can still be asked by mail.

4948. True Color Cards

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 10:47:44 UTC
From: annius@sif.research.ptt.nl
Message-ID: <annius.720701264@freyr>
Source record: 215307

ST Magazin 11 of this year reviewed the true color card SPECTRUM 1TC. For 1400 DM this is an excellent true color card (from 640x480x16million up to 1152x900x256 if I'm right). But I thought they were going to review the Mega Vision 300 which is 200DM cheaper but has similar technical specification (both up to 16 million colours and 1 meg of screen memory.)

The Mega Vision 300 claims to have a `fast and compatible' VDI screen driver. The TC1 has very reasonable software, but GEMDOS output will not be visible; does this make boot selectors unuseable? Is there anybody on the net who has one of these cards? How's the software of the MV300?

Does anybody have experiences with high resolutions and the standard TT VGA monitor?

(I plan to buy a used TT030/8/48/PCT1426 and add a true color card.)

Thanks,

I've been trying to run a colour monitor emulator to enable my high res
Mono monitor to display medium res programs. I know that the software works
as I previously tested it on a friends 520 ST, however, on my machine,
running the program just causes it to reboot. (I've tried several emulators
infact - all have the same effect).

Any ideas ? I have TOS Version 01.04 which sounds pretty old to me, is this
the cause ? If so, where can I get an upgrade from ?

Thanks in advance, for your help,

Danny

4951. Help: ICD with Miniscribe

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 11:34:13 UTC
From: ari@fwi.uva.nl
Message-ID: <1992Nov2.113413.9123@fwi.uva.nl>
Source record: 215264
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello fellow-Atarians,

Has somebody tried to connect a Miniscribe 8425S to a ST1040stfm ?
I tried it and used on old ICD host adapter (with built in Clock).
The partnumber of the adapter is 9010 (year 1987).

First i tried the diskdrive with an Apple Macintosh+ computer, it worked
ok.
But when i try it with my Atari and hostadapter, it doesn't see the
diskdrive (No disc connected), when i use the format-program that
belongs to the host-adapter. One can even select the 8425S diskdrive,
it is one of the standard formats. It keeps saying "No disc connected".
The terminating of the SCSI and the power-supplies are ok, they are
tested with the Macintosh. I can even read the onboard clock with
an ICD utility.

The hostadapter has also been tried with a (Macintosh formatted)
Quantum 52 LPS diskdrive, it didn't see that diskdrive too.

The next i tried, was to use the hostadapter with somebody else's
ST1040 and diskdrive (I am not sure what diskdrive it was, SH204, i
thought it was a Seagate). The system booted, but of course with
an already formatted diskdrive but not with the Miniscribe. It showed
that the hostadapter was ok (?).

On the Miniscribe diskdrive one can intall 6 jumpers, the SCSCI-id
jumpers (the three nearest to the connector) are empty. So it
should be on ID = 0 (the Macintosh says so too).
The fifth post is jumpered (auto-parc ?).

What do i forget? Is there somebody, who can help me with this problem ?

Thanks in advance,

Arie Maaskant.

I also use APL.68000 a lot and also find it invaluable.
Note that Ken Iverson (APL's creator) has made `J' (APL - the sequel)
shareware. It extends APL notions, is totally ASCII rather
than using the special APL symbols, and is available
for many machines - Suns, Macs, Vaxen, STs, 80x86's etc. The source
is in C (with extensive use of macros!) and I compiled version 5.1
with little bother under Lattice C and sent the executables back to
the Waterloo watserv archives. I've just seen (on comp.lang.apl)
that J version 6 is now out, and I'll compile it when time allows.

I'm not yet proficient in J, but it seems an amazing language/catalyst
for `thinking aloud'. See comp.lang.apl if you're interested.

I think you have been missing something, that 66 MHz is just a
joke a la intel. It is actually a 33 MHz processor that
runs internally 66 MHz like dx2...

PAL is actually interlaced. If memory serves correctly, line rate is
15.625kHz and frame rate is 50Hz, with 312.5 actual lines per frame.
Interlaced this gives 625 lines total. Of course only about 550 of these
are displayed on the screen.

>Bleagh. ICE packer. Fooey.

Did You ever try "afx" which comes with T.Questors LZH ??

If You don't need to write your images back to disk (e.g. a grafix library)
afx is a very good chice. You once compress your "read-only" data,
and as your favorite application tries to read this data,
it is uncompressed "on-line".

Hope this helps,

Frank.

I tend to discount STR as a reliable source of information, but that is mainly because I have dealt with the Editor in Chief on a few occasions and my opinion of his veracity is not very complimentary.

I have a hard time believing that they have shut down Falcon030 production because of all of the interest I have heard about here in the United States (believe it or not). If this is true, then all I ask that they do is create a VME DSP board for the MegaSTE and TT030 owners out there.

Wow! I thought my AutoRaise was illegal by wind_getting the WF_TOP and
simulating some left button clicks!

>After some try & error (=reboot) 8-(the scolling part seems to work.

So suppose you get this to work, how are you going to know how far to scroll
the windows? How do you know how much of the window is visible? By scanning
pixels on the scroll bars :) :) ?

>evnt_multi(MU_MESAG|MU_TIMER ...)

> - MU_MESG && ACC_open
> - host = appl_find() (names of a few prospective applications)
^^
I agree that it's a real pity you can't do
more than this...

> - wind_get(WF_TOP, ...) --> window handle
> - in_progress = TRUE
>
> - MU_TIMER && in_progress
> - wind_get(WF_VSLIDER, &pos) --> slider pos
> - wind_get(WF_VSLSIZE, &width) --> slider width

4963. DSP56001 assembler available on ftp.cs.ruu.nl

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 16:12:18 UTC
From: ate@cs.ruu.nl
Message-ID: <1992Nov2.161218.18036@cs.ruu.nl>
Source record: 215321

Hello,

Last week I compiled the DSP56001 cross assembler on my Atari ST.
This assembler was posted to a sources newsgroup (alt.sources ??) a few
months ago. I've put the program in our Atari archive (ftp.cs.ruu.nl).

We, Computer Science department, Utrecht University, are running an
anonymous FTP server on one of our systems. In addition to the FTP
service we're also running a mail server, for those of you without
direct Internet access.

--> How to get 'DSP56001' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/lang/a56.zoo
Don't forget to set binary mode!!

--> How to get 'DSP56001' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is
"fred_flintstone@stone.age.edu"; of course you must substitute
your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/lang/a56.zoo
end

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:

send HELP

A complete "ls-lR" listing of the archive is kept in the top-level
directory, it will be updated every night. To get it, issue the command:

send ls-lR.Z

That's all for now. If you encounter problems using the FTP service
and/or the mail-server, feel free to drop me a line (by e-mail, please).

>The partnumber of the adapter is 9010 (year 1987).

I've used one of the 84xx Miniscribes on the ST, and it worked fine.
My first suspician would be that the drive is set up with parity enabled
for a dos clone. I'm not sure, but that might be what the other jumper
does. Try removing it.

>The hostadapter has also been tried with a (Macintosh formatted)
>Quantum 52 LPS diskdrive, it didn't see that diskdrive too.

Old ICD host adapters can't talk to Quantum drives. They don't
recognise the extended command set. You have to get an adscsii pro

4969. Which comms package? Flash 2 ???

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 19:48:18 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1992Nov2.154818.1@sscl.uwo.ca>
Source record: 215328

Hi, yet more questions!!! I have recently got my modem up and running and would like to know which comms. package to use! I have uniterm...which seems okay but I can't get the set-up to save properly :^(When I save the set-up shouldn't the numbers in the dialer also be saved? Do I have to load these in EACH time? Seems a pain! I got the STalker3 demo and it seemed excellent...but I couldn't get a session window!!! I have TOS 1.0 (I know!) but should this be a problem? I saw a package called Flash2 at my local Atari store and it looked very nice...GEM interface etc., my question is...has anyone used Flash? Is it easy to use? I also tried the CoNnect package (from aaue) but it wouldn't run period...it was a bad weekend for trying out stuff :^(Any help concerning a good package (and especially reviews of Flash) wuold be appreciated.

p.s. Thanks muchly to those who helped me in choosing the modem itself...I went for a used (6 mos. old) Supra 2400.

>primitive operations for matrix inverse, fitting a general polynomial
>to data, etc.
>The Atari ST version is APL.68000, and is marketed by MicroAPL in the
>UK, with US distribution by the Spencer Organization. There are
>several version; I think the entry level is about $100 - $200.

I'm not sure if I'll beat L. J. Dickey to this, but since I think he's in England for a while, I may get a BIT of a lead...

I) A demo version of APL.68000 is available on Atari.archive.umich.edu. Check in the /atari/Languages directory for apl*.

It's somewhat crippled; you can't save workspaces. But it does work, and there's enough to perhaps whet some appetites for the "real thing."

II) Iverson Software (Ken Iverson was the creator of APL) has lately been working on a new language called "J". It's fairly similar to APL; has the same sorts of operations, works with matrices using surprisingly similar commands. The BIG difference is that it uses ASCII (I don't think it's EBCDIC compatible - but I'm liable to be wrong about that), and thus you get to use the regular keyboard, and combinations of the "standard" punctuation marks.

It's probably a LITTLE less readable than APL; but it's now much more machine independent.

In fact, obfusticated source code (in C) is publicly available. Even better, some people have been involved in making sure that the latest editions are available on the Atari.

To wit, I know of TWO places where it is available:

1) watserv1.waterloo.edu, on /languages/apl/j/exec/atari/j51.zoo (look at the subdirectory - there's a version with an Emacs style command line editor built in. Something like j51_atariemacs.zoo).
Bunches of J scripts and other stuff is available within the rest of the /languages/apl/j directory structure.

This seems to be the best place to get the latest edition.

2) atari.archive.umich.edu, currently on /atari/New/j51.zoo. It'll probably be moving to /atari/Languages Real Soon Now.

It includes information on how to get a real manual ($25 - pretty reasonable, I think) which is probably quite necessary for any non-trivial work with the system. If you do a phone-in order, you may even get to talk with Ken Iverson.

For further information on "J" and "APL" stuff, hang out in Comp.lang.apl.

From the Holy Book of <10864@uqcspe.cs.uq.oz.au>
as spake by warwick@cs.uq.oz.au :
>What's the problem? I'm GLAD - now we might see MiNT 2.0 soon - even if
>it is called MultiTOS and costs money. Wouldn't YOU pay for a cleaner
>version of MiNT? I would. Besides, whatever work Eric does at Atari
>will benefit us all one way or another, AND the 99% of owners that are
>non-netters too!

Only one thing bothers me about this: the possibility that the MiNTlibs
(whatever they end up being called) will become proprietary and we'll
have to become registered developers to write MiNT-savvy programs.

Otherwise, agreed, definitely a positive move on Atari's part.

4973. WHAT'S GOING ON ? ********** THE ATARI USER DISCUSSION **********

Newsgroup: comp.sys.atari.st
Date: 1992-11-02 22:59:36 UTC
From: oyakea@warren1a.its.rpi.edu
Message-ID: <cdf1tb+@rpi.edu>
Source record: 215332

I've been reading the net lately and I've been pretty bored. There's not that news coming through. I feel as Atari users we should post the latest or most recent press reports on any new products.

Now on leaving that issue I would like to discuss the Atari line of computers and it's future.
The original ST, STFM, and STE are very good machines, how can they be refurbished, enhanced, or improved.

1) It would be nice if one could get a graphics card (odin), harddisk, accelerator, ram expansion, TEC roms and an extra expansion slot for an ST. The idea I have is a standard mini tower case. One that adapts to the ST very nicely. If there is a way to get all these enhacements and peripherals to co-exist nicely within such a case this may prove to be well worth while. I encourage users to post ideas, who knows maybe San Jose computing or Toad computers may follow up on this lets just hope ther is a standard case so we don't look like a circus. The expansion slot could be a processor direct slot and could be for samplers, graphics enhancements or any other feature. This would give old ST users the chance to upgrade if they wanted to.

Applications for other computers such as the Mac, Amiga, and IBM, can sometimes be very dazzling. Can we agree that it has been a while since a New ST application has been released, that would make other computer users (the mac, ibm, amiga folk) say "ooooh ! I want that !!", I don't think so, or at least I don't know. I do know that Notator, Spectre GCR,and Pagestream had that effect.

1) Such an application should be very smooth and offer features not available on other computer lines.

On the topic of the Falcon, I've been hearing a mini tower, or at least a larger case is to be released for it. Well, if I can not get such a case I will buy a mini tower case (PC) and see if can get the thing in it. Thats the way I feel, no offense intended. I'll probably use DEKA or something else to get the detachable keyboard (if possible).

1) What kinds of applications should be released on the Falcon ?
2) People have been putting it down, especially the Amiga guys but I don't see what is wrong with it. IT'S MEANT TO BE ENTRY LEVEL !!
3) On the case of the 1200 and Falcon, I must say if the Falcon was like the 1200 I would not buy it !! The 1200 has no socketted CPU or FPU and the only thing it has going for it the AGA graphcs, which are no doubt impressive. You see if you buy a 1200 you must make your choice then if you want an FPU or not cos IT'S SOLDERED ON. TOO BAD -BAD MOVE. It was a nice try but it is too lacking as a comp-sys major I

demand more, and the Falcon gives me that.
4) Emulators on the falcon ??? Please give ideas.
5) The topic of no floppy on the Falcon was discussed - just use the SCSI II.
6) A TOASTER LIKE CARD FOR THE FALCON OR ST'S ???

I must admit the toaster is very, very, very impressive. And I praise Newtek
for developing it. The only flaw in it is that it is too tied down by the
Amigas chipset i.e. A500/A1000/A2000 - so it doesn't work on the AGA boys.
7) Port/Sharing apps./code: I feel Amiga users and Atari users could have more
respect for each other. Some Amiga apps. are very good. Share some code,
secrets, tips you might learn a thing or two. The 4000 is impressive
the Falcon is impressive, there no lie about that. Atari doesn't
advertise the ST's, CBM advertises AMIGAS.
HEY BTW- Did you know Atari was feature on 1) MTV they sponsored some
show KENNEDY was hosting and only lynxes were featured. Nice try though.
They were also featured in a panel of DOOM 3000 in Marvel Comics
Presents (in Name only).
8) HOW WILL THE FALCON DO IN THIS COUNTRY ??? AN EDUCATED GUESS ANYONE ??
9) I heard in around about way that there is going to be service for Atari
parts through G.E., is this true ?? Perhaps we could get G.E. dealers to
carry our stuff, it's DAMN AMERICAN, (ALTHOUGH MADE IN JAPAN).

********** NEW GAMES **********

Remember the first ST and Amiga games ? NO VCS or any other computer, maybe
besides the archie(ARM) ones, could come close. Will the Falcon return us
to this era?? I wish I could play MORTAL COMBAT or STREET FIGHTER II, on
the Falcon. Also new games and distribution. There should be a meeting
between the German,U.S. and U.K. dealers about; the best way to get products
available on all markets, the best way to attract crowds to see games and
applications, and ways to boost sales. I've always liked SILICA SHOP ads.

Who is the distributor for the bitmap bros in the U.S. ??
And also can some one make a detailed chart of where the st/falcon may
be going.

i'll be posting more ideas and opinions: otherwise peace amalaye.

It's strange, all the raves for 'connect' I've heard here. I tried the package in an early version, and it crashed so many times I just threw it away. Not too long ago I decided to give it another shot, and still it crashes or hangs the machine _very_ frequently. Am I the only one who has these problems?

System for SALE:

This is a whole system. The printer and modem may be separated.
Everything is close to mint for I value my things with high regard.
The internal HD is backed up! My setup is based on NeoDesk... nice setup
with software accelerators and other enhancements.

MegaSTe4/50MBHD with SC1435 monitor was bought 8/91 after sale of my 1040ST.
I bought those two items alone for $1800.
I bought the printer for $200.
I bought the modem for $200.

Note: software accumulated for over 6 years (when I had my 1040ST). Value
is hard to judge... retail (estimated) > $3000 (???).

Items:

Mega STe: 16 MHz 68000 Motorola processor, (optional) 68881/2 floating point
coprocessor, 4 megabytes of RAM, ST LOW/ST MED/ST HIGH resolutions, 4096 colors,Midi I/O,
WME-compatible Eurocard expansion slot, monitor port, RF modulator
(TV) port, parallel port, serial port, (2) RS232 modem ports, floppy disk port,
LAN interface, ACSI DMA port, ROM cartridge port, mouse/joystick & joystick,
stereo R/L ports, detachable 95-key intelligent keyboard (own microprocessor), 50 MB hard
drive (internal), double density floppy, mouse.

ATARI SC1435: 14" diagonal, ST LOW, ST MEDIUM, internal stereo speakers,
headphone port, monochrome (green), swival base.

CITIZEN 200GX: color on command, 3 built in fonts, manual load, form feed,
Epson compatible, many options, (included: ~800 pcs. printer paper, ribbons).

SUPRAModem 2400: 2400 baud rate, external compact unit.

SOFTWARE (most on 50 MB hard drive):

NeoDesk 3.02, Flash, Procopy (all versions), Word Writer ST 2.0, Print Master,
Typing Tutor, Mark William's C, Art and Film Director, Music Studio, Quick ST, Desk
Manager, etc...

Public Domain: tons of .MOD files (amiga stereo sound files) => ~ 12 MB's
worth, tons of games, tons of picture viewers, MOD players!!!, tons of pictures (SPC, GIF,
PI?, NEO, TNY), tons of utilities, tons of this/that,
tons of demos (ST/STE/excellent sound/graphics), tons of
everything of hard drive/backed up/and disks.

Commercial: 10th Frame, Airball, Arkanoid, Balance of Power, Elevator Mission,
Barbarian (2 versions), Battleships, Beyond the Ice Palace, Captain Blood,
Buggy Boy, Carrier Command, Championship Basketball, Championship Wrestling,

Chessmaster 2000, Falcon, Flight Simulator II, Hardball, Hollywood Poker,
Strip Poker, Ikari Warriors, Jet, Karate Kid II, Leisure Suit Larry in the Land
of the Lounge Lizards, Live and Let Die, Lost Duchman Mine, Manhunter: New York,Marble
Madness, Match Point, MidiMaze, Temple of Doom, Metrocross, Millipede,
Joust, Floid the Droid, Oids, Paperboy, Pinball Wizard, Prohibition, Psion
Chess, Road Runner, Star Trek: The Rebel Universe, Space Harrier, Space Station
Oblivion, Speedball, ST Vegas, ST Pool, Leather Goddesses of Phobos, StarGlider,Super
Cycle, Super Sprint, Temple of Apshai Trilogy, Terrorpods, Test Drive,
Tetris, The Guild of Thieves, Tower Toppler, Typhoon Thompson in Search for the Sea Child,
Winter Games, Zany Golf.

****

Okay. This is my whole system (whew!).

Any offers out there? I will consider all offers!

I am not going to post any starting price (or anything like that).
Let's talk... I am willing (!) to strike up an EXCELLENT deal!

The sale of this system will include support (through InterNET/email)!

Please send inquiries to:

>When I save the set-up shouldn't the numbers in the dialer also be saved?
The answer is, NO.
>Do I have to load these in EACH time? Seems a pain!
No.
Yes, I'm sure it would be a pain!

The answer to this is that there is more than one save option in the save menu. What you want to do is "Save Numbers", which saves the dialer info. into the file of your choice (preferably UNITERM.TEL, just to make sure they get auto-loaded).

>I got the STalker3 demo and it seemed excellent...but I couldn't get
>a session window!!!

Don't know the answer to this... It should automatically open a session window when you run it. At least, that's what my copy of STalker II does... And I gather from the author (a member of the local Atari users group, assuming he's paid his dues this year :-)) that version 3 is pretty much similar (I'd upgrade, but it doesn't do VT100 as well as Uniterm does, and that's crucial to me.)

The only thing I can think of is that maybe someone's been trying to hack with the demo version, and wound up breaking it...

>I saw a package called Flash2 at my local Atari store and it looked
>very nice...GEM interface etc., my question is...has anyone
>used Flash? Is it easy to use?

The original Flash was pretty good; the rumblings about Flash 2 seem to have been that it's upgraded, but make sure that you get the latest edition - the first edition that went to the stores was a little buggy.

>I also tried the CoNnect package (from aaue) but it wouldn't run
>period...

I didn't have THAT problem - I could get CoNnect to run, but wasn't too impressed as I couldn't get it to CoNnect me to my favorite minicomputer...

>p.s. Thanks muchly to those who helped me in choosing the modem itself...I
> went for a used (6 mos. old) Supra 2400.

Good choice! Supras have been serving Atari users well for a GOOD
number of years. I've been very happy with my Supra 2400. Half the
size of the ol' Atari SX212 (or is that SX1200? Can't remember...
Traded it away a year back...).

4977. Re: msa files to hard disk

Newsgroup: comp.sys.atari.st
Date: 1992-11-03 01:46:25 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <68768@cup.portal.com>
Source record: 215335

SELBYR@Meena.CC.URegina.CA asks:

>How does one put msa archived disks onto a hard drive?

It depends on why the Magic Shadow archiver was used in the
first place.

If the disk was MSA'd because it's a boot disk, the general
answer is, you don't, any more than you can copy a self-booting
game to hard drive.

If it was MSA'd to preserve its directory structures, and is NOT
self-booting, just copy the files and folders normally.

In the recent controversy over CHAOS, it turns out that once you
jump through the hoops of formatting an 82 track floppy and
recovering the original disk, you can easily copy the CHAOS.PRG
file to hard drive and run it from there.

[.sigs deleted]

Hi,

I got msa_141 to work just fine on my TT. I run it with TOS 3.06,
warp9, cache on, 1.44MB floppy. Works flawlessly. I was even able to
unmsa Choas using it (once I got the floppy 11sector formatted).

BTW, does anyone know of a share/PD formatter that formats 1.44MB
floppies in extended modes: ie, can they be formatted 20 (22) sectors/track
with up to 81(83) tracks? I know someone has posted about 1.76MB floppies
so I figure it must be possible... I used FcopyII to format a 720k disk
to 11sectors/82 tracks (I didn't try 83 tracks), but it didn't support
more than 11 sectors per track, so I probably won't use it again. :(

In article <annius.720701264@freyr> A.V.Groenink@research.ptt.nl writes:

>Does anybody have experiences with high resolutions and the standard TT VGA
>monitor?

Yes. I hooked my ptc1426 up to my roommate's IBM with a svga card
that supports 800x600 but it came out garbage (the 640x480 came out fine
though - no surprise there). So you are limited to 640x480 using the Atari
monitor. Did you expect anything else? Of course they used the cheapest
monitor that just met the specifications of the TT so as to keep costs down.

>(I plan to buy a used TT030/8/48/PCT1426 and add a true color card.)

So do I, but I don't see it happening anytime soon (for me). It would
be nice if someone could post/make a concise list of TT video cards with
specs, price, special features, and availability (at least through mail
order).

No, You don't have to do that. Its just that there is a separate
save function for the dialer. Go to where you save the setup and select the
"save numbers" and it will save your phone numbers for you. I think you
save them as Uniterm.num to have them the default numbers (they are there
when you launch Uniterm).

If you had problems with CoNnect, then lets talk about it. I'm
helping wwc@dxnhd3.mpi-hd.mpg.de (Wolfgang_Wander) with the logistics of
CoNnect, and in the process have become very familiar with it :). In fact,
I use it now instead of Uniterm (I must admit that the fact that it is
MiNT compatible was a big reason to switch, but not the only one). It is
very solid, works with Warp9 and NVDI, supports all four serial ports and
the midi port too, has rock-solid vt52->220 emulation, and scads of features.
Like many term programs, it uses external programs for up/download, but it
is relatively painless to configure - it even supports grzszacc.acc downloader.

To help, I'll need to know what you are running Connect on (hardware,
TOS#, maybe even modem), and what you are booting with (serial patch of some
sort, MiNT, others, etc.).

BTW, the newest version CoNnect1.75 should be up soon. I'll let you
know when I put it up there (if Wolfgang doesn't beat me to it :).

>these problems?

Like the other person, it would help if you could describe your
system, and we'll see what can be done.

BTW, it isn't that strange that it is getting rave reviews. It is
a good, solid program. Since it is MiNT compatible, it will very likely be
MultiTOS compatible as well (if not, the fixes _should_ be minor). Try
out the latest version, then get back to me if you still have problems.

Don't forget, since connect was made to be happy with both German
and english users, you will need to rename conneng.rsc to connect.rsc
so that the menus appear in English (and store connect.rsc in a safe place
like a subdir so you can rename the other file without an error).

In my opinion, the old Flash is still hard to beat as the best all-round, solid, all-purpose program. The new features in Flash 2 hardly justify the upgrade. and for vt100 emulation, i still like Uniterm. (yes, I have tried stalker3, which i still own, and STalk, and Interlink... all good in some ways but I always go back to Flash and Uniterm).
But that leads to another question... what is the best BBS program that is fido compatible??? I am running a BBS using Michtron 3 but am told it cannot be made fido compatible. Does Binkley stand alone or will it connect in some way to Michtron? I don't want to fiddle with a going concern if I can help it.

Hello!

Concerning your question involving using STalker3 under TOS 1.0:

I don't believe that STalker3 works under TOS 1.0 because my younger
brother tried using it with a stock 520STfm (TOS 1.0) and it didn't work.
He later installed TOS 1.4 ROMs in the same machine and the program worked
fine. In any case, I recommend that you purchase a TOS update (at least
1.4, better yet, 2.06....1.0 is almost worthless.) Also, STalker3 is an
EXCELLENT program....it even runs in the background because you can use
it as a desk accessory. Anyways, I highly recommend it.

Spader....

>is not where it used to be, it's a different server.

Everything that's going to be moved has been moved. And, for the curious,
the archive is now serviced by two ftp machines. It picks which ever
one has the lowest load and then hooks you up. I've noticed some
problems the first time I try to connect via ftp, so if this happens
to you, please try again *immediately*. It usually works then.

And, as an added bonus, you can feel free to ftp 24 hours a day now.
Not that you didn't before, but..... :)

>One thing I noticed: The files didn't retain their date and time, so you'll
>have difficulty in identifying new files.

Correct. Everything is dated the time I ftp'd them over. Sorry about
that, there was little choice.

See you in the funny pages,

Hi,

We, the IEEE student chapter on the River Campus of the University
of Rochester is hoping to have someone to present a MIDI
demonstration during one of our General Meeting.
As an atari user, I certainly realize the capabilities of Atari ST/TT/
Falcon? for MIDI and so would like to see if there is anyone
in this area that would be willing to show us some nice stuff.
We are not looking for a big presentation but some intoduction
stuff as most of our audiences will come from those who
knew nothing about MIDI but we will certainly try to attract
all other people if we can get a decent setup.
please contact me or Chris Van Leuvan (cvnl_ltd@uhura.cc.rochester.edu)
for more information.
Thank you
...
Ling Cherd

All this talk of Flash II, if more of you read ST-Report you would have found
out there is a REAL FLASH II comming out, its called THE STORM and NOTE;
its by Allan Page the Flash 1.6 man..

Its a complete re-write and has mutible windows, background dnloads,
and uses Basic as its script language, based on the old Atari 8 bit Basic...

Will be releast by Double Click, when I don't know.....

So go find some of those ST-Reports a few weeks back, has a lot more info about
it and is writen by Allan Page...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Running CoNnect on a TOS older than 1.04 is quite a problem.
You can succeed replacing the original fileselector by e.g. selectric.
With Selectric CoNnect works fine even with TOS 1.00 or 1.02.

Wolfgang

> samplers, graphics enhancements or any other feature. This would give
> old ST users the chance to upgrade if they wanted to.

Adding a hard disk really doesn't depend on what kind of case the ST is in.
But I can certainly see how having a large tower-style case would make it
easier to fit other goodies in.

Personally I think the processor-direct slot is an albatross, just cements the
machine to the past. There's no reason to go with any "expansion" technology
that only lets you plug in one expansion device. The Mega STe and the TT have
a VMEbus slot, I think this should be the standard expansion bus technology
used for all STs. (I.e., if you're gonna talk about shoehorning a new type
of expansion onto an old ST, please choose VMEbus, which is a well-established
standard, instead of going with yet another custom single-device nobody-else-
in-the-world-uses-it expansion method.) Of course, a brief glance at the
VME bus spec will reveal that the bus signals are already very similar to
the signals used on Motorola processors. (Not surprising, since VMEbus was
originally designed by Motorola for their line of processors.) In that respect,
VMEbus is not very different from what you'd have to cram into a processor-
direct slot. The difference in bus control/arbitration additions is negligible
now since you can get single-chip VME bus interface controllers and such.

Of course, you don't need to put *everything* on the VMEbus. It still makes
sense for system RAM and ROM to live on a private bus, just like the way STs
and TTs already work. But you could stick myriad enhancements on the VME -
graphics boards, custom coprocessors, ethernet network controllers, serial

port multiplexors, etc. etc. etc... VME is definitely the best way to go.

> Applications for other computers such as the Mac, Amiga, and IBM, can
>4) Emulators on the falcon ??? Please give ideas.

Hm. I can't say that I have much use for emulators, really. If you wanted
to run that PC or Mac app, ya should've bought a PC or Mac.

>7) Port/Sharing apps./code: I feel Amiga users and Atari users could have more
> respect for each other. Some Amiga apps. are very good. Share some code,
> secrets, tips you might learn a thing or two. The 4000 is impressive
> the Falcon is impressive, there no lie about that. Atari doesn't
> advertise the ST's, CBM advertises AMIGAS.

Basic algorithms, no problem. Complete applications, kind of difficult. The
Amiga programming environment is rather different from most "traditional"
environments, it takes a different mindset (one which I never got accustomed
to, must say). Even with MultiTOS on the ST the two will remain very different
since MiNT/MultiTOS takes a Unix-ish approach and AmigaDOS looks (to me) like
IBM CMS...

>8) HOW WILL THE FALCON DO IN THIS COUNTRY ??? AN EDUCATED GUESS ANYONE ??

Depends on advertising. Without ads, there's no reason to expect anyone
new to hear about it. No new customer base, no new sales, goes nowhere.

>9) I heard in around about way that there is going to be service for Atari
> parts through G.E., is this true ?? Perhaps we could get G.E. dealers to
> carry our stuff, it's DAMN AMERICAN, (ALTHOUGH MADE IN JAPAN).

I thought it was made in Taiwan. Japan isn't the cheap "backwater" it used
to be, their massive success with capitalism and industrialism has given
'em as high a cost of living as we "enjoy" here...

4997. FALCONs screen modes!

Newsgroup: comp.sys.atari.st
Date: 1992-11-03 10:40:29 UTC
From: mpnolan@unix1.tcd.ie
Message-ID: <mpnolan.720787229@unix1.tcd.ie>
Source record: 215254

I like what Atari have done with the Falcon!
It has good sound, good graphics, and seems to build on all the strong points about the 'old' ST range......which means I'll hopefully own one soon..

However, I've heard an awful lot of conflicting informaton on the Falcons screen modes and the hertz they run at!

Could someone who KNOWS what they're talking about please enlighten me.
What EXACTLY are the Falcons resolutions? Do you have freedom to change othe resolutions and then the colours, within certain memory limits?
(or are the resolutoins rigid - which isin't a bad thing for compatibility)

At what speed are the reolutions transmitted, and does the lack of speed in some cause flicker? - if so, would a GOOD monitor offset this?

For reference,(as I own an STFM, and know that the resolutions it has are solid non-flicker) at what speed are STFM screens transmitted at?

Thanks in advance, and please no snotty mail from any amiga owners!
Mark Nolan.

Hi netters,
In response to a request for the price of the Infinity Floptical Drive
by PLI that I purchased at the WAACE show from Joppa Computers, the show
price was:
Drive and cable (one 21 Mbyte floppy included) 435 dollars
Same as above with ICD Link 535 dollars

I waited until the last few hours of the show when Joppa traditionally
reduces everything they bring by 10 per cent and got a bargain.
Thanks for your interest,
Daniel Koppen

5008. Ghost Virus

Newsgroup: comp.sys.atari.st
Date: 1992-11-03 15:14:44 UTC
From: cgra@se.alcbel.be
Message-ID: <1273@se.alcbel.be>
Source record: 215283

I have been foolish enough to get my ST hard disc infected with the Ghost virus - and lived with the symptoms for several weeks before I suddenly saw the light and ran a virus scan (Sagrotan). As soon as I saw the name "Ghost" I realised that I had found the reason not only for the disappearing mouse cursor that had prompted me to run the scan, but for the eponymous "ghost files" which had been appearing in my directories for some time.

My thanks for this entertaining gift are due to Bitz in Halle, Belgium, who supplied the virus as an unsolicited extra on their disc containing a shareware comms program.

1. Ghost has now settled comfortably into my system. Anyone able to give advice on how to eliminate it? No I don't have a complete backup of the hard disc which is both recent and demonstrably virus-free; if I was that concientious then I would probably never have got myself into this mess. My present plan of action is to reload all .PRG, .APP, .TOS, .TTP files from their original (virus-free) distribution diskettes. If the worst comes to the worst I suppose I will just save all the data files I have time, floppies and patience enough for and than reformat the hard disc.

2. Does anyone have or know of a list of known viruses and their tell-tale symptoms? If I had spotted those ghost files straight off then I could have taken action much sooner.

Cheers, and thanks in anticipation,

Chris

If you save the numbers in a file called UNITERM.TEL these will be loaded automatically. The file should be in the same directory as UNITERM.PRG.

> The expansion slot could be a processor direct slot and could be for
> samplers, graphics enhancements or any other feature. This would give
> old ST users the chance to upgrade if they wanted to.

As I understand it (and someone please correct me if I'm wrong), the Megabus
on the Mega computers is somewhat of a processor direct slot (in rough terms,
would you say?). I believe that JRI here in California, who is current
working with Lexicor on a genlock system for the Falcon, has a way in which
you can attach a Megabus port to the ST/STE computers.

Additionally, in terms of the tower case, mini or otherwise, not everyone
wants to put their peripherals and additions in a tower case, let alone
spend money in such a fragile market as we have here. I wouldn't bet that
they'd be willing to spend much money on an expansion chassis. Moreover,
I don't know any developer here in US who'd be willing to take on such
a job; the project wouldn't be worth his while, financially or otherwise.

Moreover, I don't think it would be too easy or even cost-efficient to
put RAM expansions, ROM upgrades, accelerators, and the like in a
separate case. I remember a brief discussion on GEnie in which some users

asked if Gadgets by Small's SST could be sold in a separate case and somehow attached to the ST, similar to your expansion chassis idea. They said they'd have numerous technical problems with that, including FCC clearance.

> On the topic of the Falcon, I've been hearing a mini tower, or at least a
>larger case is to be released for it. Well, if I can not get such a case
>I will buy a mini tower case (PC) and see if can get the thing in it.
>Thats the way I feel, no offense intended. I'll probably use DEKA or
>something else to get the detachable keyboard (if possible).

You probably won't be able to get the Falcon into a mini-tower case. The motherboard is too large.

>1) What kinds of applications should be released on the Falcon ?

Graphics, music/sound, and multimedia applications would be nice. As well as applications that we already have on our beloved ST/TT machines, just for compatibility sake, you know.

>4) Emulators on the falcon ??? Please give ideas.

PC and Mac.

>6) A TOASTER LIKE CARD FOR THE FALCON OR ST'S ???

I don't know if it'll be in the form of a card, but it will have similar features at a lower cost. That's what the rumors say anyway. (Don't hold your breath though.)

>8) HOW WILL THE FALCON DO IN THIS COUNTRY ??? AN EDUCATED GUESS ANYONE ??

Atari knows what they have to do and it's up to them to do it; they can't rely on anyone else. They want to expand their market share here, but it's not going to happen overnight. Hopefully things take place as Atari has planned them to.

>9) I heard in around about way that there is going to be service for Atari
> parts through G.E., is this true ?? Perhaps we could get G.E. dealers to
> carry our stuff, it's DAMN AMERICAN, (ALTHOUGH MADE IN JAPAN).

Actually, I think the computers are made in Taiwan. I believe the GE thing has been settled, but Atari hasn't made any announcements of it. They'll probably wait until the Falcon is out.

> Remember the first ST and Amiga games ? NO VCS or any other computer, maybe
>besides the archie(ARM) ones, could come close. Will the Falcon return us
>to this era?? I wish I could play MORTAL COMBAT or STREET FIGHTER II, on
>the Falcon. Also new games and distribution. There should be a meeting
>between the German,U.S. and U.K. dealers about; the best way to get products
>available on all markets, the best way to attract crowds to see games and
>applications, and ways to boost sales. I've always liked SILICA SHOP ads.

There doesn't have to been any meetings between dealers to discover the best way to get products for the ST, attract crowds to see games and applications, and boost sales. The only way you're going to do that is to sell more

computers.

> And also can some one make a detailed chart of where the st/falcon may
> be going.

I think Ross Perot said he was going to be making a half-hour show for this,
complete with charts and down-home witticisms.

I saw that beast too, and I had a chance to run test program done
by me on the machine since nobody seemed to care. The program
opens some windows and runs animated quixlines graphics in them.
It does not have any timing mechanisms (neither delay loops nor
evnt_timer() calls), and on a plain old ST its speed ranges from
really slow to moderate, depending on how many windows are
actually open.
On that 68040 machine, it ran pretty fast even with all seven
windows open, and with just one window, I was really afraid the
quix might break the window borders!
More seriously, I'd estimate on the 68040 machine the program was
running at roughly five-fold speed compared to an 8 MHz ST. The
CPU was claimed to run at 66MHz internally and 33 MHz externally,
so I figure my estimate makes some sense. It must be considered
that the RAM in the Mega ST that was used as a host for the board
is still used as video RAM, so graphics will not be accelerated
as much as numbercrunching stuff.
Of course, if compilers and libraries that support the '030 or
even the '040 are used, the speed increase should be
significantly greater than the one observed when running
unmodifiet 68000 code on the 68040 board.

Message-ID: <DARYL.92Nov3104122@piano.adept.ih.att.com>
Source record: 215286

One suggestion for new ported software would be products like XVT or Neuron Data porting packages. You can write software using these products (they are tools and function libraries) and be portable to a large number of platforms.

I have used XVT and it works well. Making porting software to the Atari line very cheap and easy could go a long way to getting good software on many machine lines, not just Atari machines.

(XVT currently supports alot of stuff including Mac, PC, and UNIX/X11)

| : ICE packer, on the other hand, is crap.
| :
|
| I beg your pardon? Pack-Ice is one of the most useful programs I've come
| across, it packs better than PFX-Pack and unpacks faster! It saved me
| ca. 5-6 Mb on my harddisk!
|
I have a copy of ICE, but I don't use it. It's just one in a long line of packers which I have tried, used for a while and then abandoned, along with:
The Happy computer packer
4-pak
The Pompey Pirates Packer
etc.

The one I use now is PFX pack. Why? because it packs/unpacks fast, well, and it does not crash under MiNT (unlike the PPP). And it does not waste cycles by flashing useless patterns at me while it works. That's one of my major gripes with these programs; the other being that they take so damned LONG to pack a file. Thank God for PFX-pack!

Is it just me or did no one get any thing I posted last week? The address
of choice is, has been, and always will be atari.archive.umich.edu. If
it still references the old machine, wait a bit for your name servers
to update; the alias was change yesterday. If you can't use
the name address, try either 141.211.182.23 or 141.211.165.41 or get afs and
mount the damn thing on your desktop.

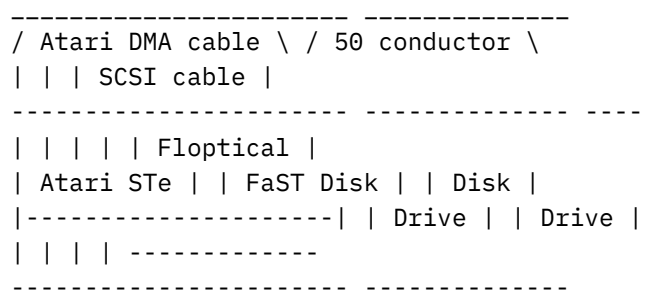
Hi netters,
Since I've had a few inquires as to the details of setting up the hardware with a floptical, I thought I would just post the description. Unfortunately, it got a little long. <sigh> If you are interested, please read on.
I tried to make a few drawings to show how I have my setup wired together. My ASCII art technique is not what it should be, but I hope you can make out enough of the details that they are helpful.
My FaST disk drive looks like Figure 1 on the inside. The AdSCSI board is mounted toward the back of the case. On the left side there is a connector mounted on the AdSCSI board and extending through a hole in the case. This is where I connect the DMA cable coming from the STe. Next to it is another connector (not marked on the drawing) which is just a through port for the Atari DMA. On the right, there is a 50 pin connector that looks like a giant printer socket. I think they call them centronics connectors. At least it kind of looks like the same kind of connector that is on the side of my Epson printer.

Internals of FaST Drive
Figure 1

You can see from Figure 1, the SCSI signals come off the right end
of the AdSCSI board and travel down a 50 conductor ribbon cable to both
the Seagate ST296N SCSI disk drive and also to the external connector.
There are two connectors on the back of the floptical drive that are
identical to the one on the back of the FaST drive. The cable that came
with the floptical had a 25 pin connector (RS232 looking) on one end and
the 50 conductor centronics connector on the other. That cable works great
with the MacIntosh I tried it with, but wouldn't work at all with the Atari.
Fortunately, since I'm something of an experimenter I had the proper
cable laying around, but if memory serves me correctly, this cable can be
purchased for 15-20 dollars, or you can make your own. :)
When all is said and done, the whole works looks like Figure 2, below.



Interconecting cables
Figure 2

Since my original posting I have noticed a few 'quirks' that might be
worth mentioning.
Quirk 1 - If the floptical drive can not read an inserted disk for
whatever reason, the drive will not read any subsequent disks
even if they are formated properly. You MUST reboot (warm boot OK)
Quirk 2 - The floptical drive reads, writes, and formats 'standard' floppy
disks. This includes both high and double density formats, but
NOT 10 sector or other custom atari formats. Go back to Quirk 1.
Quirk 3 - You can not do disk-to-disk transfers even if the disk in the
floptical is identical format to the one in the floppy. The
message is that the floptical is a hard drive and does not
support that type of operation. However, you do not go back
to Quirk 1.
Thanks for reading this far,

Roger,
as you know that I am no big fan of Atari corporation I question the validity of this letter myself. There are some things that are unclear at this point and time but what strikes me most, he spelled the word "grusses" wrong. As a matter of fact, there is no such things as "grusses." Furthermore, every german knows that it would be spelled "Gruesse." However, "With friendly Gruesse" doesn't make sense and doesn't sound right to begin with. Let's not mention that it should be capital...

Personally, I have my doubts about this letter. Maybe it is true and maybe it isn't. Who knows. Based on the facts mentioned above, I am very surprised to see him mispell words (german) and connecting to Fido to post such a message.

Whatever the case, I still think Atari Corporation will require LOTS of work...

Julian,
I have to agree with you on this one. I think someone saw the book "Sex"
by Madonna and likes to shock people as well. Outrage sells! -)

Is Normen Kowalewski the new head of Atari Europe (Germany)?
Did I mention that he is related to me (Verwandter)....8-)
Just kidding. I know many don't like to hear it.

Best Regards,
Mark Kovarski

I've just seen the Jekyll 1.32 program and feel it could be useful for transferring files from my BBS computer to my own. Can the author be contacted through Internet? I'd like to see a MIDI port option to maximize the speed of transfer when the computers can be directly connected and to save the hassle of disconnecting the serial cable. I would just leave the MIDI cables connected all of the time and only have to run Jekyll on each computer to move files between them. I'm sure this would be quicker than using floppies. Any other ideas on how to do this at minimum cost?

The HERMES UUCP Package contains UUENCODE/UUDECODE. But there are stand
alone versions, too. (Maybe called UUE or UUX)

Erik.Williams@p0.f169.n363.z1.fidonet.org (Erik Williams) writes:

(Stuff deleted)

|> I have a hard time believing that they have shut down Falcon030 production
|>because of all of the interest I have heard about here in the United States
|>(believe it or not). If this is true, then all I ask that they do is
create a
|>VME DSP board for the Mega STE and TT030 owners out there.

My TT is barely a year old, and I have no plans for a Falcon in the near
future. But I would love to see a Falcon-compatible DSP board for the
TT/Mega STE. (I have my doubts about the STE, though. Falcon software
would likely be 68030-specific, and the STE runs on a 68000).

I don't expect Atari to produce that board. Looks like a perfect opportunity
for a third party to me.

A few weeks ago, I asked the folks on the Atari Productivity Forum (on
CI$) whether a Falcon-compatible DSP board was possible for the TT. I
got a reply from a well-known hardware guru, who told me that it was
impossible, because apparently the address of the DSP on the Falcon is
an illegal address on the TT. He also said someting to the effect that
the way the DSP chip is integrated to the Falcon hardware makes
emulation difficult or impossible. I would like to hear what
knowledgeable people on the Net have to say about this, because I
suspect Mr Hardware Guru has a vested interest in discouraging people
from building a card he might want to be the first to commercialize.

So tell me: will I some day run Falcon software on my TT?

5033. Re: art packages for a ST?

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 04:42:33 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1d7kbpINNkdc@golem.wcc.govt.nz>
Source record: 215285

The best art package I've seen, is probably 'Crack-art'. Which is
Share-ware (The latest version is only fully usable with a registered
copy). Does everything, bezier-type curves, wrapping pictures around
shapes, hi-tech zoom, LOADS of special effects (anti-alias etc.), Buit
built in anti-tedium devices (simple game modules). Multiple screens,
the works! Does a lot more that most fully priced commercial packages,
and all for only $US20 (I think).

Well worth a look!

The latest version is available at:

sun.rz.tu-clausthal.de

in:

/pub/atari/graphics/painter

filename: crackart.lzh

It's big - but it's GOOD!

(1meg only - but anyone with less should be shot! 8-)

Try booting with a completely blank floppy disk - (NOT from HD). And
then switch into med' res with the same disk. Create the 600K RAM-Disk,
and copy the chaos file into it, and go from there. Also, make sure
your disk is okay! (Format it with Verify turned on to make sure!!)

Source record: 215294

Good - my section of knowledge (viruses)....

The GHOST virus on a Hard-drive should be easily killable using Sagrotan, if you can't get rid of it with that, try and find 'Ultimate Virus Killer' which is nice and simple to use. (The 'Douglas Communications' version is nice and cheap - and seems to the job nicely!!)

There is a program called 'Guardian' which will prevent writing of any executable information to boot-sectors. THis has saved my data several times in the past - and is only 1k!! (If anyone wants it, I'll UU-encode it and throw it through the net!)

The Ghost/Mouse Invertor virus is usually a boot-only virus, but if you manage to find the Link-virus 'Ghost' (Not bright to give 2 viruses the same name, but what the hey!)

on atari.archive.umich.edu, there is a file somewhere (in the atari/utilities/virus directory I think) called 'atarivir.lzh' which tells of most Atari viruses around!

This brings to mind a couple of questions i've been meaning to ask someone...

What are these accelerator cards supposed to be used for/what are they compatible with?

And same for any of the graphics expansion cards....what are they compatible with/supposed to be used for? Are they compatible with STe 4096 color mode or what?

Source record: 215300

Afte doing tests. NO WAY is ice in ANY way faster than PFX-Pack. It unpacks marginally slower, and takes a LOT longer to get only fractionally better compression (maybe an extra 2k on a 50k file - If you're lucky!)

PFX-Pack is fast, packing & unpacking - it's mega-simple to use, it doesn't waste unpacking time with the colour flashing, and LHarc will unpack the files back to their usual state if you can't be bothered to re-load PFX-pack to unpack them!

ICE has it's uses (the source code for the unpacking routines is all over the place, so lots of people have integrated it into their software but it's still slow)

Well, it must be true if you've seen it in an advert :-)

Actually, you can't buy one in the UK yet. I rang several suppliers last
Friday (30 Oct) and the less reputable ones (eg Gasteiner) said that they
could definitely supply in two weeks. The better suppliers (eg Cambridge
Business Systems) said that they were hoping to get Falcons soon, but
could not commit to a fixed date on anything that comes from Atari UK!

I've got a MegaVision 300, and was one of the first to get one. The software
is now good, but SANG has not yet finished a 24bit driver for it which I
am NOT satisfied with. The card only works with 256 colors. When it comes to
speed..... teh card is not good. It is faster for every softwareversion
but you will need a TT with fastram to get a decent speed. It is OK to work
with but Crazy Dots and the Spectrum cards are faster.....

5047. THE STORM

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 10:00:01 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1d86v1INNInl@golem.wcc.govt.nz>
Source record: 215108

Well as I have had a request for this, I am posting this now..

This was Posted on GEnie on the 4th Sept 92..

For Immediate Release
Double Click Software
September 4, 1992
==========

Double Click Software proudly presents...

Storm
by Alan Page

Many of you will recognize the name Alan Page as the author of the _best_
selling, most popular terminal software ever written for the Atari computer,
the original Flash!

Alan's innovative, solid programming made the original Flash the #1 selling
telecommunications software for the Atari computer, bar none. Now Alan has
devised and produced the next-generation of telecommunications for you, Storm.

If you are like us, you have been frustrated with telecommunications software
released since the original Flash was introduced. Our hopes, anxiety and
anticipation of promising terminal programs has often been turned into a big
let-down when we finally saw that none could match the power, ease and
solidity of the original Flash. In fact, most terminal software is still
measured in usefullness comparative to the original Flash.

That is until now.

Storm is the next step for telecommunications as only Alan Page can produce.
His expertise and mastery of programming is sure to set a new standard by
which all other terminal software will be measured. And only Double Click
Software can bring this delight to you.

Here are some of the features of STORM:

o Works on all versions of TOS in all resolutions except LOW.
Including the TT and the new Falcon.

o BASIC script language. That's right! No new programmer's idea of
a script language that is sort of like some programming language.
This one _is_ BASIC, with powerful extensions for telecommunications.
We'll describe it a bit more later, with a brief example.

o 100% MultiTOS compatible.

o Everything is in a window: terminal screen, capture buffers, editors, BASICs, download/upload status, dialing status.

o Unlimited editor and capture buffers, and BASICs (under MultiTOS)

o Simple, yet powerful editor with full mouse control, cut and paste, full word wrap, Atari clipboard support, and more.

o Capture buffer keeps capturing even if you are not in the terminal window. This means you can start your capture, and view it at your leisure without losing anything, without being in the terminal window. Heck, you can even close the terminal window!

o Freeze the current capture buffer and start a new one at any time.

o Multitasking - be online downloading, editing and running a BASIC program all at the same time. In fact, you can start a new copy of BASIC at any time (without MultiTOS, with MultiTOS it's better yet!).

o Powerful macro keys let you interpret the macro instructions as BASIC commands. You can even chain function keys, which can start a new copy of BASIC. You can even define the cursor keys!

o Full type ahead support, with special prefix and suffix extensions, and control character pass through.

o Simple layered Windows (tm) style menus which greatly simplify keystroke memorization for quick, easy, expert command execution.

o Pop-up menus (with a pop-up menu command in BASIC so you can define your own as well).

o Loadable background file transfers in X,Y,Zmodem and Compuserve's B+.

o Background round-robin dialing with auto-logon BASIC scripts. And the size of your dial directory is completely unlimited!

o Precise terminal emulations including Vidtex and VT100.

o And still much more!

And now for a brief description of Storm BASIC (in Alan's own words):

The BASIC interpreter is a fairly complete BASIC with special extensions for telecommunications. It was originally based on Atari 8-bit BASIC, but has been redesigned and enhanced considerably.

Summary of Features:

�� String and integer variable types, plus string and integer arrays.
Arrays can have a maximum of two dimensions.
Integers are 32 bit integers.
Full set of string functions, including string search.
Runs in its own window.
Event handling for timer, clipboard, and carrier detect events.
Chain command to run programs in a separate interpreter. Chain level

limited only be memory.
Allocates all memory as needed.

BASIC runs cooperatively with the rest of the program. So you can access the editor, capture buffer, terminal screen, or whatever, while a program is running. You can even switch away in the middle of a BASIC "INPUT" statement which is waiting for input.

BASIC is very sparing of memory. All the memory it needs is allocated as needed. e.g. each line or string is allocated separately, so it is not a memory hog. Each string can (in theory) be up to 32K in size.

Here are a few examples of the more interesting BASIC commands:

String functions
================

These are all "Microsoft" style string functions as can be found in GW-Basic or QBASIC. "string" in the examples below can be a string, or string variable, or string function. You can nest functions quite deeply.

e.g. PRINT MID$(LEFT$("ALANPAGE",2)+CHR$(ASC("A"))+RIGHT$("NNN",1),1,4)
Prints "ALAN"

The typical string addition and comparision functions are supported, e.g. '+', '=', '<>', '>=', '<=','<' and '>' .

UCASE$("string")
LCASE$("string")
These two functions return the string converted to all uppercase / lowercase respectively.

SPACE$(n)
Returns a string of n spaces.

INSTR([start,]"string","key")

This is a string search function. It searches "string" for substring "key" and returns the starting index of "key" in "string", or 0 for failure. 'start' is optional and is the location in the string to start at. N.B. The first location in a string is location 1. Also, no matter where you start searching in the string, INSTR always returns an index relative to the start of the string.

Example: INSTR("12345","3") and INSTR(3,"12345","3") both return 3.

SCREEN$(linenumber)

This returns a line of text from terminal screen line 'linenumber'. The first line of the screen is 1. Trailing spaces are stripped from the line, so a blank line is returned as "".

LTRIM$ can be used to strip leading spaces.

SCREEN$ and INSTR should let you write very powerful scripts where you can read information off the screen and take context-sensitive actions.

Telecommunication-specific functions
====================================

I have made some attempt to be compatible with Flash for some commands.

CAPTURE ON Turns capture on.
CAPTURE OFF Turns capture off.
CAPTURE CLEAR Clears the capture buffer.

Serial Port Functions

BAUD nn
Sets baud rate to nn.

PARITY EVEN or PARITY ODD or PARITY NONE
Sets serial port parity.

SBITS 1 or SBITS 2 or SBITS 3
Sets stop bits to 1, 2, or 1.5 respectively.

STRIP ON or STRIP OFF
Sets high-bit strip feature on or off.

DTR ON
DTR OFF
These commands turn the DTR (Data Terminal Ready) signal on or off at the serial port.

CSRLIN
returns what line terminal screen cursor is on.

POS(n)
returns cursor x position, (starts at 1). 'n' is a dummy argument.

SAVE CAPTURE "filename"
Saves the capture buffer to "filename".

FSEL$("path","filename")
Pops up the GEM file selector and returns the full filename you selected, including the full path.

ALERT(1,"[1][alert][OK]")
Lets you display a standard GEM alert box.

WAIT nn,"string"[,"string",...]

This is the most important command for automated operation. You can wait for multiple strings with a timeout value (in seconds). Basic will match characters coming in the serial port with the strings and continue with the next statement when either the string is matched, or a timeout occurs. Naturally, all program functions are enabled while the wait is in progress.

A timeout value of -1 waits forever (actually, about 60 days).

Once the WAIT statment has executed, use the WAIT(0) function to determine the result.

WAIT(0) returns 0 if there was a timeout, otherwise it returns the string number that was matched, starting at 1 for the first string. So you could use ON WAIT (0) GOSUB 100,200,300,etc.

Example:

```
10 wait 20,"Password"
20 if wait(0) then type "password"
```

TERM ON
TERM OFF
Turn terminal operation on and off.

KEYINPUT A$
This statement waits for a keypress in the Terminal screen window and then puts the keypress in the specified string variable (A$ or whatever you choose). While it's waiting for a keypress, terminal operation continues.

PROMPT$(n)
This function takes up to n characters from before the current terminal screen cursor position and returns it as a string. Doesn't go past the beginning of the current line. Useful for getting the current prompt when automating operations.

A sample program MACRO.BAS shows how all these functions and commands work together. MACRO.BAS is a recorder program that will record what you type in and the associated prompt. It will write out a BASIC program that will play back the series of actions.

CLIPTEST.BAS
============

```
10 CLIP ON
20 ON CLIP(1) GOSUB 60:REM setup clip event
30 PAUSE -1:REM wait forever, or until UNDO key hit
40 END
50 REM Every time you select a filename, following subroutine is called
60 a$= RTRIM$( CLIP$):REM trash end of line
70 REM Truncate filename at "/" in case it was accidentally included.
80 x= INSTR(a$,"/"):IF x>0 THEN a$= LEFT$(a$,x-1)
90 IF a$="" THEN RETURN :' Nothing to do!
100 TYPE "Dow ";a$;" PROTO:B"
110 WAIT 20,"computer:"
120 IF WAIT(0)=1 THEN TYPE a$
130 RETURN
```

CIS.BAS
=======

```
10 REM CIS logon script
20 REM start by sending control-c
30 TYPE CHR$(3);
40 WAIT 20,"Name","ID","Password"
50 ON WAIT(0) GOSUB 100,200,300
60 IF WAIT(0) THEN 40 ELSE 30
```

```
100 TYPE "CIS":RETURN
200 TYPE "70000,0000":RETURN
300 TYPE "my.password":POP :REM "POP" pops return stack
400 PRINT "Done!"
```

==========

Well, that's enough for now. You can catch a glimpse of STORM at the Glendale Atarifest by dropping by the GEnie booth. Darlah Potechin will be using STORM to demonstrate GEnie.

STORM will make landfall on December 7, 1992 and will have a special introductory price of $59.95 until December 31, 1992. You can order your copy today, and get it before it hits the stores!

On January 1, 1993 the price goes up to $74.95.

We accept cash, checks, money orders, MasterCard and VISA.

Outside the US orders: NO PERSONAL CHECKS.

Include $3 for shipping anywhere in the world (special offer only).
Include $10 for overnight shipping in North America (special offer only).

Well you chaps that have me in your Kill files will miss this good News, well that your problem, I don't have Kill files for my TV/Radio or News Papers and the magazines that I read, I like to read all thats Good and Bad...

There is some more info I will post about what Allan Page has been doing, and some more of the STORM features, apparently he has been working in the U.K on PC machines and Windows, and stated that what he has learnt with these, he has put to good use in developing the STORM...

Roger..... sheppard_r@kosmos.wcc.govt.nz

5048. Some TT/Falcon info please

Newsgroup: comp.sys.atari.st

I need to make some stuff on an ST that uses more than 16 colors. Now I'll like to use stuff like GfA Basic and GenST. I think there are two options, a TT or a Falcon. So what I would like to know is..

Do GfA Basic/GenST/Neochrome work on the TT without any trouble in >16 colors mode? And do they work on the Falcon? (I heard GfA doesn't)

If somebody could email me some details, I'd be much obliged.

Stefan

>A few weeks ago, I asked the folks on the Atari Productivity Forum (on
>CI$) whether a Falcon-compatible DSP board was possible for the TT. I
>got a reply from a well-known hardware guru, who told me that it was
>impossible, because apparently the address of the DSP on the Falcon is
>an illegal address on the TT. He also said someting to the effect that
>the way the DSP chip is integrated to the Falcon hardware makes
>emulation difficult or impossible. I would like to hear what
>knowledgeable people on the Net have to say about this, because I
>suspect Mr Hardware Guru has a vested interest in discouraging people
>from building a card he might want to be the first to commercialize.

>So tell me: will I some day run Falcon software on my TT?

This is just my educated guess, and I'm not too educated
regarding hardware, I guess:

I'm not surprised to hear that DSP addresses in the Falcon are
illegal in the TT. Obviously, the integration of the DSP into the
Falcon is much like the integration of other chips: It's
registers are mapped to memory locations in the CPU's address
space ($FFFFsomething). And since there's no DSP in the TT, these
locations are illegal (undefined) in the TT.
However, I think there's no necessity to insist on compatibility
on the memory location level. It still seems perfectly feasible
to me to develop a DSP expansion for the VME (or even any other)
slot, and to write some TOS extension that implements the
Falcon's DSP-related OS calls on the TT.
I don't have any idea what the DSP-related OS calls of the Falcon
are like, and whether any are present in the current TOS 4.0 for
the Falcon that was presented on the recent shows. However, it
was said at the Atari Messe that in MultiTOS there will be calls
allowing applications to enter DSP programs into a queue, and
MultiTOS will then run these programs on the DSP fifo-wise.

5054. Questions I need answers to :-)

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 11:16:05 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <1d8bdlINNm2e@golem.wcc.govt.nz>
Source record: 215113

Hello all,
A guy from our user group asked me some questions, and I need
some help with these ones please...

Is the program "Freestyle", a MIDI sequencer PD, or is it commercial.
If it's PD, where is it available from?

Is there any PD Fax software available? Or commercial _without_ the modem?

He has a 24 pin printer, Epson compatable, and wanted to know about
getting printer drivers for it... are there any PD ones out there?
He wants to be able to print stuff from the following programs....
Degas Elite, Delux Paint, Crask Art, First Word, Word Writer,
Write On, Pagestream, Print Master.

Is the Neochrome Tutor that was on an ST Format coverdisc earlier this
year available from any of the FTP sites? He wants that too!

Also, a question from me!... What is the story behind printer drivers?
I always here people saying they want a printer driver for such & such
a printer... I always thought that each program had their own printer
driver + format for it.
So is there some independant printer driver format for the ST, or does
each program need it's own?

Thanks,
Email answers on the top questions prefered to shore_c@kosmos.wcc.govt.nz
as I don't think there will be many others interested.
Followup to the newsgroup about the printer drivers though, i'm interested
to see the general opnion of everyone.

Craig.

I think so too, but there is an option in the menu to invert the colour (ie dark background/light foreground). Press the Help key to get the menus, then the option is within the Terminal1 menu item (in "settings" menu?). Simply select "dark" for the background and remember to save the config if you want it to always look like that. Uniterm resets the display colours when it exits.

I don't have my ST to hand now (ie at work), so the menu names aren't strictly accurate, but I'm sure you'll find the option, if not, mail me...

Steven.Wells@bbs.actrix.gen.nz writes:
: Afte doing tests. NO WAY is ice in ANY way faster than PFX-Pack. It unpacks
: marginally slower, and takes a LOT longer to get only fractionally better
: compression (maybe an extra 2k on a 50k file - If you're lucky!)

Hmm... My tests showed that Pack-Ice compresses up to 10-15% better
than PFX-Pack, and uncompresses FASTER! (On a Mega Ste at least).
:
: PFX-Pack is fast, packing & unpacking - it's mega-simple to use, it
: doesn't waste unpacking time with the colour flashing, and LHarc will
: unpack the files back to their usual state if you can't be bothered to
: re-load PFX-pack to unpack them!

Again, Pack-Ice does NOT flash colours or anything! Ok, there is no unpacker
included in Pack-Ice, but then again, for PFX-pack there is no verifying
code. There are a couple of unpackers for Pack-Ice too (like the Naughty
Unpacker by yours truly or Multi-Depacker by Mike Mee).

: ICE has it's uses (the source code for the unpacking routines is all over
: the place, so lots of people have integrated it into their software but
: it's still slow)

Don't forget that PFX-Pack is SHAREWARE, and Pack-Ice costs nothing!

But surely hou've heard about the VDI, which puts these nice texts,
circles, rasters etc. on your screen.
This is made by a screen-driver.
If you've got a GDOS (NVDI, AMC-GDOS...) you can install printer-
(plotter...) drivers, which put the same on your printer with maximum
resolution.

Whith the same program, that writes on your screen, you can write
on our printer. The changes in your program are only minor
(Open Workstation, different co-ordinates)

Hope that helps.

5061. Atari Prices

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 13:41:51 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <4NOV92.08415184@cc4.crl.aecl.ca>
Source record: 215123

The 92-16 edition of AEO stated that Atari hardware prices have had a sharp drop. Would someone at Atari USA please explain why the Sept 92 Canadian dealer price list has a 2 meg TT priced at $34 higher than I had been paying for a 4 meg TT from Atari Canada before it folded? If there has been a major price drop in the US, it certainly has NOT been reflected in Canadian dealer pricing! I FAXed several inquiries to Atari USA re: pricing and have, as yet, not received any reply other than from Barbara Benson who stated she does not set policy and that I should talk to someone else.

Perhaps someone could pass this message to AEO for their next issue!

5064. Falcon Audio Info, pretty please (plus, true-color tidbit)

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 13:56:55 UTC
From: tonyb@juliet.ll.mit.edu
Message-ID: <TONYB.92Nov4135655@titania.juliet.ll.mit.edu>
Source record: 215145

A couple of weeks ago someone dropped a posting into rec.audio.pro saying that the Falcon would have 8 channel digital audio recording capabilities, with some healthy DSP power to boot, *standard*, and at some amazingly low price.

I'm sure that this has been beaten to death already, but I've been reading the group for a few days now and everyone seems obsessed with beating each other up over the definition of "true color". So could someone please help me out a bit, and do one or more of the following?

1) E-mail or post a quick description of what you know about the audio sampling capabilities of the Falcon, and the projected price of a system (minus the big disk drive) that would allow this to happen.

2) give me some idea of who/how to call for product info

3) suggest an Atari magazine to read to get more info

I'd much appreciate it. I'm just a heathen IBM-clone developer, but my real passion is recording studio work. If what the person posted in r.a.pro was even close to correct, I want one of these ASAP!

Thanks a ton,

Tony

P.S. -- for what it's worth, I've been involved in professional color image system development (not DTP, but big systems from Scitex, etc) for a long time now. As far as *I* can tell, the term "true color" has always meant "at least three colors, with at least 8 pits per pixel per color". Implicit in this is that there be no limitation on the number of simultaneous colors on the screen. However, no one gives a damn if there is a lookup table involved or not (in fact, there almost always is, somewhere in the system). The real point is, can the system process and display a reasonable approximation of a continuous tone color image? That is usually considered to require at least 24 bits/pixel for video systems, and 32 bits/pixel for most hardcopy systems, but if someone comes up with a coding scheme that doesn't use fixed bits, or RGB or CMYK coding that's fine -- but can it display the picture without artifacts? *That* is what true-color is.

5065. THE STORM and VT200???

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 14:01:02 UTC
From: richardson@sscl.uwo.ca
Message-ID: <1992Nov4.100102.1@sscl.uwo.ca>
Source record: 215125

Perhaps I should have e-mailed directly to Roger but does he (or anyone else) know if THE STORM has VT200 emulation. At present I am using Uniterm, which is excellent for emulation but not too user friendly (IMHO). Perhaps STORM will have a nice interface with VT200 emulation...sigh! Also, I haven't tried the 'original' Flash (latest Alan did was 1.6...right!) Does Flash have VT200?

>If anyone could point me in the right direction I would be most gratefull.
>Many thanks in anticipation,
>Rob Thompson, robt@inmos.com

Bill Rosenkrantz' man package is quite good; it's at a.a. The manpager
only works in ST mono mode, since it uses LineA to change fonts.
There's also another package by Hildo Biersma (?) which is nice too.
It uses the standard Un*x convention of having nroff sources in man*
dirs and formatted pages in cat* dirs. Bill's version expects
formatted pages in the man* dirs. But that version can also handle
compressed (.Z) pages.
I always nroff my sources here at uni though, since there I get a
clean nroff run on pages which choke my nroff at home.

5067. graphics: atari st -> windows

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 14:18:03 UTC
From: mlrettel@cip.informatik.uni-erlangen.de
Message-ID: <Bx73q3.7F3@immd4.informatik.uni-erlangen.de>
Source record: 215134

Hello

A friend of mine has got a problem converting graphics of the Atari ST
to WINDOWS (PC). I'm not sure if this is the right group for asking this
questions, but perhaps someone can help me anyway.

My friend wants to use lots of pictures made by CALAMUS and other
drawing tools on the ST. He wants to change to Windows and wants to use
this graphics under PC-GEOS.
The formats on the ST are CVG, SMG and/or GEM
The formats on the Windows-System are CGM, PCX and/or TIF

My questions: is there any chance to save the pictures on the ST in a
right way, so that the Windows-program can read it?
If not: is there any program that does the conversion?

Please answer by email, because our news-system is not too safe. Thanks!

Michael

Source record: 215131

Has anyone tried out the "Reference" hard drives from Evesham Micros?

This is the only dealer that has Atari stuff anywhere near me and I think that these are the only ones they sell for the Atari.

So, are these any good? and are they worth the price. (299? pounds=40 meg?) I *could* buy one from mail order but I don't like the idea of sending off my money when I can't tell if I will get anything back.(OK so I'm paranoid...)

Is it easy to take out the host adaptor so I can use it as a SCSI drive?

What is the difference (if any) between the Link and adscsi(?) ?

Also, will any IDE or scsi drive work if you have got a IDE or scsi interface?

Excuse the amount of questions...
Phil

In article <4762@equinox.unr.edu>, chan@pyramid.unr.edu (Kaho Chan) writes:
>What happened to terminator????????
>
>ANY IDEAS,????

Nothing happened to terminator, the atari.archive FTP site has simply MOVED to another machine. This is why, with great patience, Jeff Weiner has been telling people to use the Internet alias 'atari.archive.umich.edu' instead of trying to get to the direct machine.

A note -- if your TCP/IP name resolver caches Internet addresses, the name resolver may still be picking up the old alias address (which was the terminator machine). You will need to have your system administrator flush the name resolver cache in order to pick up on the new alias addresses.

Another note -- you can no longer retrieve files from the atari/New directory (I tried to do it, and got a 'no can do' message from the FTP daemon). However, with any luck, the files that are currently there will be moved to the atari/Newitems directory by the end of the week.

Source record: 215138

I've just uploaded the following to atari.archive.umich.edu (in /atari/New)

(1) finder10.zoo - A Desk Accessory/.prg that somewhat resembles grep. Doesn't do regular expressions, but will search directories, and uses a file selector. Related to the "GEM Grep Utility" thread. By Bill Aycock, of Cal fame.

(2) lpsolvebin.zoo - A linear program optimizer that can also do integer programming. Originally posted on Comp.sources.reviewed. It works quite well, and seems pretty stable. The only major "lack" is in post-optimality analysis.

(3) lpsolvesrc.zoo - The source code for (2). Requires some form of ANSI C. It's quite portable - runs identically on the ST and a variety of "higher horsepower" machines.

I can see these in the directory (unlike the way the "old" /New directory worked), but can't read them. Hopefully the dust will settle at a.a.u.e fairly soon, and things will get relatively back to normal.

A big thanks in advance to Jeff Weiner, and the new "rest of the crew" of archive maintainers!

I have just got an ICD The Link and it works very well, basically it plugs into the SCSI port of your drive and draws it's 5v from pin 26. The DMA of your atari connects to the other side and away you go. I got mine from gastiener for 70 pounds all in. The software see all the disk's that I've tried so far without any probs. It even fixes my TOS 1.0 problems with copying files etc...

I also have a viper 150mb tape drive for archiving which works well with the ICD and Alan Houraines tape backup program.

Craig

PS I have a 200mb disk and tape drive for Sale if your interested. It's in a home made 19" rack unit but works perfectly well. If your interested, reply whenever.

5080. TOS 1.4 questions

From: wmtwen@rw8.urc.tue.nl
Message-ID: <6167@tuegate.tue.nl>
Source record: 215141

Hi,

on monday I will get my ST back with TOS 1.4 instead of TOS 1.0.
I know TOS 2.06 is a lot better but this was a lot cheaper.
MY question is : what patches do I still need, as there are still some
things in TOS 1.4 or 1.04 whatever that need fixing. I understand that
I no longer have the 40 folder problem (correct???).
But what serial port problems do I still have, and what about disk
routines? I now have a megafile 60 and normal internal 720 floppy. Do I
still need fatspeed (guess not). And what book describes the changes?
I have a good book that describes TOS 1.0 completely and part of TOS
1.2 but I heard TOS 1.4 has some extra systemcalls like Mxalloc.

I guess that now I have TOS 1.4 everybody should get TOS 1.4 because
there is a chance that programs I write might not work with earlier TOS
versions now :)

Erlend.

Yeah, I would stay far away from Flash 2 until they release a maintenance upgrade, which as far as I know doesn't exist yet. (Anyone from Missionware lurking in the shadows? :)). Flash 1.6 is still a great program, and solid as a rock.

Anyway, about STalker3, from what I've seen of it, it runs the terminal session in a GEM window. I have two questions about this:
1) can it display a full 80 columns on screen?
2) how fast does it scroll incoming text through a fast (v32bis) modem? Is it real fast like Flash 1.6, i.e. can it keep up with the data without handshaking constantly?

5083. Re: Atari TT - Question

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 18:11:02 UTC
From: grier@bnr.ca
Message-ID: <1992Nov04.181102.8534@bnr.ca>
Source record: 215154

My TT is configured as follows:
2mBytes of ST-Ram
4mBytes of TT-Ram
1.4Mbyte floppy
85mByte Seagate 1096n
Chinon CDX-431 CD-Rom

My "Auto" folder contains
MetaDos2
Warp9TT
MACCELL3
MINT95

My Accs are:
Paula1.8
Stalker
Steno
CPX
TOSWIN

I run everything possible out of TT-Ram, only MetaDos2 is set to
run in ST-Ram. TT-Ram gives a substantial increase in performance,
on the order of %50 for non-screen intensive work. I have ound no
compatability problems running MiNT in TT-RAM vs ST-RAM. There does
seem to be some problem with Paula1.8 and MiNT, Paula1.8 locks up
if I switch between different windows under TOSWIN, causing an obnoxious
noise from the speakers. I have to access Paula1.8 and tell it to
play a different '.MOD' file then stop to clear the noise.

I do not regularly use GCC, I normally use Pure-C, but I have had no
problem running it from TT-Ram.

The biggest problem with MiNT/TOSWIN on a TT is the need for more pixels.
Once I get three or four shells running I get very upset at 640x480,
I am looking into the Overscan for the TT, but I do not want to deal
with Rio Computers after the fiasco with the Lexicor software I bought
from them.

These quirks are quite interesting. Especially #2, since all of my floppies have a 10-sector format.

I wonder if Quirk 1 is an ICDBOOT problem that may be fixed in the future.

If you don't mind, I'm going to leave mail to ICD on GEnie and see what they say about these problems.

I thought the ghost virus would only infect the boot sectors of floppies.
I don't think it's on your hard drive (although I could be wrong).

What you should do is get a copy of Virus Killer 3.84 from atari.archive.
That should get rid of it.

>--Gerry

No it means that the operating system will not allow you to drag
the Drive C icon to the Drive A icon.

A possibly simple solution to this is to use NeoDesk3. If it encounters
a situation where a drive icon is dragged to another drive icon it will
ask you how wish the copy to be performed. (Sector copy, if formats match,
or file-by-file copying). I know this is what happens with hard-drive
icons, tonight I'll verify by trying to drag my "tmp" partition to drive A.
I post my results in the morning, GMT-5hours.

: >Many thanks in anticipation,
: >Rob Thompson, robt@inmos.com
:
: Bill Rosenkrantz' man package is quite good; it's at a.a. The manpager
: only works in ST mono mode, since it uses LineA to change fonts.
: There's also another package by Hildo Biersma (?) which is nice too.
: It uses the standard Un*x convention of having nroff sources in man*
: dirs and formatted pages in cat* dirs. Bill's version expects
: formatted pages in the man* dirs. But that version can also handle
: compressed (.Z) pages.
: I always nroff my sources here at uni though, since there I get a
: clean nroff run on pages which choke my nroff at home.
:

I use HPP Biersma's man3 package, and Bill Rosenkranz's nroff 1.21b.
'less -r -s' does the paging... All of these can be found on
"archive.umich.edu" (former atari.archive.umich.edu) in the Mint
and Gnustuff directories...

-MY

PS: nroff 1.21b seems to put some non-ascii characters in it's output,
even without "-T", so "less" outputs a warning. Does anybody know
how I can avoid this?

5092. Atari.archive problems with the New dir

Newsgroup: comp.sys.atari.st
Date: 1992-11-04 21:49:21 UTC
From: mbaffoni@skat.usc.edu
Message-ID: <1d9gh1INNfha@skat.usc.edu>
Source record: 215143

Hi all,

I was trying to get some files from atari.archive and it seems
to have some problems.

First, all of the files in the New directory are visible using ls.
You can't get any info on them using dir (actually, there are some files
that you can see using dir, but only those with rights of -rw-r----- or
better). It appears that the anonymous account has suddenly taken on group
rights (rather than just the "everyone else" rights I thought it was supposed
to have). This isn't technically a problem but ...

Second, even though you can see them, you can't download any of the
files. Small problem there. :) Actually, now that I think about it, I haven't
tried to download _any_ of the files outside of the New directory...maybe they
are all like that? I'll have to go check.

(Mike checks it out)

The other files seem to be fine, just problems with (the MANY!) files
sitting in the New directory.

If Jeff N' Co. could help with this, I would really appreciate it.

Thanks!

MikeB

>Anyway, about STalker3, from what I've seen of it, it runs the terminal
>session in a GEM window. I have two questions about this:
> 1) can it display a full 80 columns on screen?

Yes it can, just make the window the full screen and remove the vertical slider by typing ALT-"|". The menu bar may be removed by typing ALT-"_". You still don't get 25 lines, but if you run it as a program, you get 23 or 24 I think. Also, if your computer is fast enough you can use GDOS which allows you to pretty much use any font you want to get the right number of rows/columns for your window (Although this isn't very useful if you only have a color monitor since the fonts are too small if you try to squeeze more than 80x25 on the screen).

> 2) how fast does it scroll incoming text through a fast (v32bis)
> modem? Is it real fast like Flash 1.6, i.e. can it keep up
> with the data without handshaking constantly?

I'm not sure about this, my modem is only 1200 bps, ewwwww. Ask Dan Aylward, he has a fast modem with his TT... Dan? I must say I've been impressed with it every time I go over to his house to visit his computer. :-) Beats the heck out of this H19 terminal I'm using now.

In my last post, I said yuo could remove the STalker title/menu bar by typing ALT-"_", what I really meant was you can remove the horizontal sliede by typing ALT-"_" and the menu bar can be removed with ALT-"~".

And like Dan said, you get an extra line if you run it as a program, due to the subtraction of the desktop menu bar (but it's not nearly as cool then... :)

Ah, the beauty of afs file permissions. You see, as I may have mentioned
before, and some have dully noted, the archive is now on afs space.
File permissions mean nothing in the traditional sense.

> Second, even though you can see them, you can't download any of the
>files. Small problem there. :) Actually, now that I think about it, I haven't
>tried to download _any_ of the files outside of the New directory...maybe they
>are all like that? I'll have to go check.
>

Nope, just the files in the new directory. You see, the original idea
was this: once uploaded, the public shouldn't be able to check out the
files until we do. This prevents people from doing zany things
like uploading the tos source code or something that some other corporation
would have their lawyers contact us about. In the past, this wasn't completely
possible. But, thanks to the god-like structure of the afs acls,
(access control lists), we can prevent you folks from reading the
files before we do.

> The other files seem to be fine, just problems with (the MANY!) files
>sitting in the New directory.
>

Thus creating the other problem, the fact that there are many files that
I'd like you all to have access to. Well, I'm trying to solve that
by recruiting other members to the umich atari posse. There's 4 new
people who have offered their part time services to give me a hand.
It is my hope that together, we can move these files out quickly. Once
the backlog is gone, you should notice practically immediate service.

> If Jeff N' Co. could help with this, I would really appreciate it.

Oh we're trying Mike, we're trying. Please folks, bear with us on this.
I'd like to ideally make atari archive the largest atari archive in the

planet. It'll just take a bit of time to get things going again.

The moral of the story: don't ever become a grad student if you can avoid it.

5100. Re: Ghost Virus

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 00:29:00 UTC
From: Volker_Soehnitz@ac.maus.de
Message-ID: <A11070@AC.maus.de>
Source record: 215018

Hi Chris!

>I have been foolish enough to get my ST hard disc infected with the Ghost
>virus - and lived with the symptoms for several weeks before I suddenly
>saw the light and ran a virus scan (Sagrotan). As soon as I saw the name
>"Ghost" I realised that I had found the reason not only for the disappearing
>mouse cursor that had prompted me to run the scan, but for the eponymous
>"ghost files" which had been appearing in my directories for some time.

Oooops! None of the more than 10 (!) known different versions of the "Ghost virus" is able to infect your harddisk! Also, none of them will create "ghost files" on your disks or harddisks.

>1. Ghost has now settled comfortably into my system. Anyone able to give
>advice on how to eliminate it?

I don't know, who or what is responsible for your harddisk trouble, but you can believe me - it's _not_ the Ghost virus or any known mutation of the Ghost virus. It's a really harmless bootsector-virus, some mutations can damage a disk in drive A or B - but none of them make any trouble with your harddisk or manipulate executable programms.

A little comment to your viruskiller: The last shareware release of "Sagrotan" (4.17) is more than 2 years old! Using a 2 years old viruskiller is like using _no_ viruskiller...

If you look for another shareware-viruskiller, try it with my VIRENDETEKTOR 3.1g! This Programm recognize more than 40 bootsector-viruses (and 5 link-viruses).

But I think there would be a little disadvantage for you: VIRENDETEKTOR is only available with a german manual (more than 160 KByte on disk) and the programm-menu is also completely in german language.

If you understand a little bit of german, I'm sure the VIRENDETEKTOR is "just what you need". My english ist to bad, to explain all the features of this programm, so I tell you only the most important:

VIRENDETEKTOR works with all ATARI ST/STE/TT, with the FALCON 030 (some problems with the IDE-Bus harddisk will be fixed soon...) and on all graphic-cards, but the programm needs a minimum resolution of 640*400.

It is _not_ possible to use the programm on machines with less than 1 MB RAM, but it is a "light"-Version for 512 K machines available.

Recognition of ALL known ST viruses - both link- and bootsector-viruses (also on _not_ executable bootsektors).

Very fast scanning of a whole drive or partition for link-viruses,
CRC-Checksum (50 times faster than Sagrotan) by choice.

Immunizing of disks against bootsector-viruses with three different methodes.

Automatic recognition of any hard-, floppy- and RAMdisks attached.

Automatic analysing for suspicious/unknown boot disks.

VIRENDETEKTOR give you a list of all your programms, which are packed by one
of these "online-packer" like for example the PFX-PACK, ICE-Pack, DC-Squeeze,
BA-Packer and others.

Recognition of any change in HD-rootsektor, if a virus has overwritten the
rootsektor, it is possible to restore it.

Option to save any bootsektor to a disk to have them analysed by me or to
restore it after a damage (a nice feature for game-disks). HEX-Dump to disk or
printer available.

Full compatibility with any ROM TOS and any known harddisk driver.

Comfortable and easy mouse/keyboard user interface (german language).

More than 160 KByte manual (german!) on disk, you learn everything about
viruses on the ST!

VIRENDETEKTOR is Shareware, you can get the new registered version 3.1g by
sending 35,- DM (30,- DM + 5 DM for shipping) or 25 US-Dollar to:

Volker Soehnitz
Beginenstr. 17
D-5100 Aachen
Germany

>2. Does anyone have or know of a list of known viruses and their tell-tale
>symptoms?

The registered version of VIRENDETEKTOR also contains detailed information
about the known viruses, what the do, under which condition the will do it and
how the spread.

ciao | /
|/olker

PS.: I hope you understand my horrible english...

PPS.: If you need a viruskiller with english manual and user interface, the UVK
from Richard Karsmakers (NL) should be your first choice.

Source record: 215158
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.misc,comp.sys.apple2

To Bulletin Board System Operators:

The HiTECH Group is establishing a new support system for all U.S. BBS operators called *STAR*LINK*, in conjunction with its unique new *UNIVERSE* Network for consumers and businesses. Due to anticipated overwhelming response we are releasing information in controlled stages. The first general information release will be on or after November 6, 1992 to the same parties having received this preliminary ALERT! notice. Thanks for any assistance you can give us in getting this word out - we think you will be very pleased you did.

ALERT!!! ALERT!!! ALERT!!! ALERT!!! ALERT!!! ALERT!!! ALERT!!! ALERT!!!

On October 30th, 54 years ago, aliens "landed" in Grovers Mill, New Jersey - thanks to the wonder of that era's technology and communications. it was only Orson Welles' radio play on CBS, but it convinced and scared almost half the country that heard Mercury Theatre's 'reporters' realistically describing this "invasion".
Now that we have survived this year's double scare of Halloween and Election Day, we are alerting people across the country to a much more positive use of today's communications and technology. The opposite of an alien invasion, it has been developing over the last nine years, as a way to harness people in a new system for positive change. Unaffected by the election, a series of announcements and events during the first part of November will explain that this 'HiTECH' system is not a political force or new philosophy, just a better way of using existing technology. Its thrust is to put large numbers of people to work, pulling together even larger segments of the general population in order to benefit them and the U.S. business community, while shoring up our financial system, creating a new form of technology education, and improving our environment.
If you think you might be interested in becoming part of this 'HiTECH' system for positive change, participation is totally voluntary and open to almost everyone over 16 years of age with a computer and a modem (we may even supply the latter). To find out the details that might affect you or people you know - just make note of where you saw or heard the ALERT! message, whom you pass it on to and stay tuned to your friendly local (or distant) BBS for complete information.
While next time you'll be able to reach us On-Line, for now we are:

Does anyone know if the Gemulator is available for sale in Australia ?
Fred

5104. Hardware scrolling big screen emulator for TT

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 02:30:34 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Nov5.023034.14701@u.washington.edu>
Source record: 215159

Does anyone know of a big screen emulator that works on the TT? I used Darek Mihocka's MonSTEr on my Mega STe and loved it, but it doesn't work on the TT. I'm stuck in ST high for Calamus. I ftp'd "stretch", which sounded promising, but for some reason it says "STe scrolling hardware not detected" or something to that effect. I thought the TT had all of that... Any other suggestions?

Thanks,

Dan Aylward
dud@u.washington.edu

By using the icon font you can get 80X25 easily, if your eyes can hack
it... There may be a GDOS font that I haven't found that lets you also.
Of course, with monochrome or TT resolutions, there's no problem at all! :)

>> 2) how fast does it scroll incoming text through a fast (v32bis)

>impressed with it every time I go over to his house to visit his
>computer. :-) Beats the heck out of this H19 terminal I'm using now.

Hehe, I'm impressed with it too! :) On my Mega STe, I believe the GDOS
output just barely kept up with the incoming 9600 v.42bis (no v.32bis).
It was hard to tell... With the system font there was definitely no
problem, especially with Warp9 installed. Of course, on this machine,
there's no way the modem can outrun it! :)

So get a TT or a higher-res board, and you can resize the window to fit
your tastes... (and Falcon overscan modes would work, too).

I dearly love Freeze Term, but if it turns out even half as good as
predicted, I've been intending to switch to Storm since Sept...

Hm. Or perhaps he'd consider an option for a smaller font (9 point?)
inside the terminal window. In fact, selectable font size would be
helpful for the vision-impaired, too. Anyone know how to pass this
suggestion on to Allan Page?

Anyone know why when I try to run an spx viewer (spx18.prg), on my color t.v. via r/f modulator, the screen continously looks like the vertical hold is not working?

The t.v. is so new it doesn't even have a vertical hold control.

Is this the 50/60 mhz output thing?

Mike

5111. How to Backup Mint partitions

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 06:40:05 UTC
From: pdel@ADS.COM
Message-ID: <1992Nov5.064005.11733@ads.com>
Source record: 215167

Howdy all, since installing Mint, I've been wondering how to back up the partition. Simon Gornall's readme from his distribution says that if you access the Mint partition from GEM, you'll corrupt it. Does this mean that if I use a GEM backup program, I'll trash the Mint partition? Should I tar it or use a .ttp backup program instead?

thanks for any enlightenment,

PD

Howard waxes nostalgic about VMEBUS on Atari computers..

I agree, a "standard" buss would be great to have..

Unfortunately, the Atari implementation of the VMEBUSS is about
as standard as the Atari implementation of the SCSI buss was
on the ST..

It should probably be called the "AVME Buss" to differentiate
it from what the rest of the world considers to be a "VMEBUSS"..

An aside.. has ANYONE.. EVER.. found an "off the shelf"
3U formfactor VME board that they wanted to put in their
Atari "VME slot"...????

I really would like to know...

Stephen Jacobs writes:

>The announcement that there would be Falcons in the US as soon as FCC approv
>could be obtained, and probably in mid-October came directly from Sam Tramie
>One of the more important things to learn in dealing with US corporations is
>that the president is never an official spokesman for the company. Basicall
>anything the president says is a wish, not a commitment. To the best of my
>knowledge, the only official spokesman for Atari in public discussions is
>Bob Brodie.

Say what...??

You mean to tell us that if Lee Iacocca tells the world in a
Press Conference that Chrysler will be bringing out a new model
car in November that will get 200 mpg and cost $500, that it
ISN'T an "official" announcement, and we have to wait for
"Joe Nobody" in the Chrysler marketing department to give us
the "real" scoop..?

I'm sorry... that's just B.S...

If the President of Atari Corp can get on a national information
service and give out "information", that "information" is as
"official" as it gets.

I don't remember any disclaimers before or after the conference saying
that anything Sam Tramiel says is not to be considered truthful or
"official"...

I'll bet Sam himself would be surprised to find out that Bob Brodie
outranks him in the "official" capacity..

And... I think Sam can probably do his own apologizing...

(3:713/602) writes:

sr> This refers to some phone contacts with PARAGON Computer's
sr> in Perth Western Australia...
No apostrophe ^

sr> This is the bigest distributer of Atari Computers in OZZ..

Not true - they are one of the larger 3rd-party importers, yes.

sr> I contacted them back in May/June about getting TOS 2.06,
sr> they informed me that they were getting some from Atari OZZ soon.

Yup - or, more to the point, that they had been told by atari Oz that they
were going to get some. A.O. told me that too.

sr> A friend would like his Mega STE upgraded to TOS 2.06 and a 1.4 meg
sr> drive..
sr> I have heared that there are kits for this in the USA...
sr> Well Paragon stated that there was a 2 year waiting list for 1.4 meg
sr> drives, or some thing to that effect, I then asked about TOS 2.06, he
sr> stated that Atari OZZ had let them down and they were hoping to get
some
sr> from Compo U.K.

You can get a 1.4 drive from A.O. - presuming you want to pay $280 for a
very ordinary drive. Alternatively, you can track down an Epson SMD-340 and
change over the faceplate - the SMD-300 may also work, I'll follow up on
that, as I'll be getting one in the next few days for the TT.

sr> I also asked about the replacment GAL chip, and the chap stated what
GAL
sr> chip !,
sr> never heared any thing about a new GAL..??

Neither have I - is his faulty?

sr> I have allready delt with Atari OZZ and it took 12 Toll calls to get
sr> replacment DMA chips, also there Service manager did not know what TOS
sr> 2.06 Roms were...???

Yup... The problems with A.O. are well known, and as a rule we avoid them
like the plague. It's taken them 4 1/2 months so far, and our Dev. kit
still hasn't arrived.

sr> Tell me is this Support..???
sr> So tell me chaps do you think that people should stick to Atari, if you
sr> do you must nead your head seeing to...

As a rule, I go to atari in the US when I need support - and to be frank, that isn't often. If I want spare parts, well then I just have to pull a few strings. Try making some friends one day, RS, it might help more than you think.

>1) Has anyone experience using TT and MiNT?

Yes, I use MiNT on my TT all the time.. they were made for each other :-).

>
>2) What memory configuration do I need to compile with GCC ?

As the minimum memory on a TT is 2MBytes, any TT will be able to run GCC,
but I would recommend at least 4MBytes to do anything worthwhile.

>
>3) How much faster than the usual RAM is the FAST-RAM ?

With a compute intensive task it can be up to 1.5 time faster than "ST-RAM".
Programs compiled with GCC with the -m68020 option usually get a doubling of
speed relitive to the same code compiled on an ST.

I think the newest version of Sagrotan is a commercial one (5.x?). I don't know where to get it. One of the last noncommercial versions (4.14 or 4.17) was translated to english by a norwegian. He is running a norwegian ST usergroup and a PD-library based on floppies and (snail) mail. Name, adress and telephone as follows:

Stein Arne Jensen
STUG Norway
Skogenfeltet
N-3630 Roedberg
Norway
Tl.f. +47 3 741473

I am not sure if I remember the details correctly (version numbers etc.) but he can give you all the details.

5125. THE STORM Allan Page

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 10:13:14 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1das3qlNN1co@golem.wcc.govt.nz>
Source record: 215179

Well here is one more bit that I found care of ST-Report 837...

Alan Page, the author of STORM, tells us:

"Storm is completely different from Flash. It's also completely redesigned. As much as possible I made it modular and internally multitasking. The terminal emulations and file transfers are loadable modules. Right now I have CompuServe Vidtex (which is a whole lot like VT52) and TTY. Current file transfer modules are X/Ymodem and CIS BPlus with resumable downloads.

The editor is in a resizable movable window with FULL word wrap. e.g. delete and backspace will activate wordwrap. No more hitting the F10 key to reformat. You can have as many editing windows as GEM will let you (with MultiTOS, the number of windows seems to be limited only by memory).

The capture buffer is an editor window, but with the special property that text gets added to the end of it from the serial port. You can create a new capture buffer and turn the old one into a regular edit window. You can edit a file at the same time text is being captured.

File transfers run in the background. Not full background/reset-proof like Shadow, but better than STalker which stops when you enter the menu bar.

Command language is a full Basic interpreter. It also multitasks with the rest of the program. So you can run Basic, edit files, do file transfers, all at the same time. Basic has re-entrant execution. So if you define a function key to execute a Basic command, it stops the current Basic program, creates a new Basic interpreter (less than 1K overhead), runs the function key macro, then the current Basic program restarts. Same thing for the dial directory autologon.

Basic (and the rest of the program) allocate memory sparingly and release memory back to the system. The program is completely MultiTOS compatible and in fact run 90% of the time in MultiTOS.

Storm also supports the Atari clipboard for cut and paste. I use a custom font and driver for extra speed. However, it doesn't cheat with GEM and works on TT and should work on other programs. It's 12 pixels high with monochrome so you get 24 lines in a window with room for a typeahead."

Albert Dayes asks some good questions:

"Within the Window does STORM give you 80 columns? In some other windowing software one gets less than 80 columns due to the scroll bars etc? Also is there a 132 column mode? Since everything is loadable one should be able to create almost any type of emulation. Will there be a special developer kit for this or will it be included in the program?"

Alan Page answers:

"You get 80 columns in the terminal window. There is not as yet 132 columns. I will probably have 132 columns, but you would have to scroll unless you have a machine with higher resolution graphics. I will release source code for the loadable emulations at some point. I will probably not have documented it enough to release it at the time we ship Storm because getting the program out is the #1 priority."

Hal Dougherty asks Alan Page:

"Didn't you write the original Flash?"

Alan answers:

"Yes I wrote the original Flash. However, Antic Publishing owned the trademark. Apparently, before they went bust they sold the trademark (even though they owed me $$). Storm is a completely new program. Not a line of code from the original Flash is in it."

Brought to you by ST-Report 837..

If you bury your head in the sand and don't read ST-Report thats your problem, there are otheres here that have access to GEnie but do nothing for the net, how about getting of your buts and doing some thing postive..:-)...

Also those of you that will never know as you have me in your kill files, well all I can say get a New Brain as you do nead one...

Roger.............

I don't live by kill files but by my intellegence....

I wish more netters had some of that...??

NOTE to anyone who might know me: This posting is as a favour for a friend
who owns one of these things...

As the subject line says, what happened to Bart? Last lot of files I
requested did not get through for a whole week. Yes I know that the directories
now all start with capitals, and no I'm not going over the 400K limit.

Any ideas?

> Where may I find Sagrotan (what's the newest version) in english?
>Thanks!!!

As I know the newest version is the 4.17 and there will be no newer
version because it got a commercial product. I don't remember the new
name of it, but that doesn't matter because I think it's silly to sell a
commercial viruskiller.
I don't know if there is an english version of sagrotan.

I've heard something about sakrotan (instead of sagrotan). Does anybody
know more about it? What is your favourite Viruskiller? Did you ever
get a virus? I normally don't use disks and I never had problems. I
always boot from the same write protected disk.

5131. How should I read RS232 in Turbo-C on 1040ST-f

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 12:43:02 UTC
From: mndell@cs.ruu.nl
Message-ID: <1992Nov5.124302.11670@cs.ruu.nl>
Source record: 215187

Is there anyone who could tell me how I can read data using
an atari 1040ST from the RS232 port at 9600 baud, in turbo C?

I played around with Rsconf, Bconstat/in, Cauxis/in but
nothing seems to work properly (with B there is always data
even when there isn't and with C never even when there is)
Could be I'm doing something wrong but I don't want to waste
too much time on figuring out, so I'm asking you :-)

If you know how it works, have some examples, please E-mail me..

thanks in advance!!

Mike

5134. New version of my BSD Unix-like init(8) package uploaded to a.a

Newsgroup: comp.sys.atari.st
Date: 1992-11-05 12:59:13 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Nov05.125913.30287@bas-a.bcc.ac.uk>
Source record: 215185

I've just uploaded the latest version of my (and Dave Gymer's) BSD Unix-like init(8) package onto Atari.archive.umich.edu. The file you will find there (initsnb.zoo) is the source and binary distribution, I failed to upload the binary only distribution (initbin.zoo) because the tranfer kept failing with EDOTDOT errors, I will retry tomorrow.

The changes from the original distribution include random salts for the password encryption, getty being able to change the speed of the serial ports (though this is dubious on the extra ports on the TT for some reason) and there are a few new programs including a fixed version of the Bourne Shell look-a-like, ash.

Steve

PS. One other major improvement... init prints a copyright message with my name on it at boot time! :-)

>>Shearware/PD emulator for the ST? (ie site).

> I highly recommend Connect! It has VT220 emulation and is shareware.
>You can get the latest greatest version up on Atari.archive.

You can also use Uniterm (also available on atari.archive). Uniterm does a full VT2xx emulation, some VT3xx and even Tek4014 (for graphics). I use it all the time and (of course...!) am very happy with it. Moreover, it does not use GEM windows. The big drawback is that you can't resize it in a window, or use it in a "multi-task" environment, like Connect. BUT the screen updates are MUCH faster than Connect. I don't like slow screen display, thence I use Uniterm...

P.S.: I use a Mega 4 computer. Maybe with a TT the screen updates are faster in Connect. I don't care... but you might!

P.P.S.: Uniterm supports up to 132 columns by 50 lines, if you need it... but the characters are a bit small.

As far as I'm concerned, the GEMulator is one big joke. As somebody once
said on the net here, why would somebody want to run Atari ST programs if
they had a PC? I surely wouldn't. This is not to mention that you need
a minimum <Snicker!!> 486-33 machine to run at 100% Atari ST speed.
Yeah, right! Give me a break, Darek J. Mihocka!!!!! All I can say is,
"Good riddance to sour grapes!" The only decent program he ever made for
the ST was Quick ST (now called Warp 9, distributed by CodeHead
Technologies).

The TT doesn't have the STE's hardware scrolling, but I'd like to see a big screen emulator too.

Also, the guy who originated this message only logged three times to MAUS ST: Once to enter his name, then ended up with a carrier lost in his second trz and finally set off his mail in an third attempt.
After that, he was never seen again.

>The msg originated on a Macintosh in a German hacker network. That alone
>should tell you enough. Please don't waste bandwith even further.

I cannot agree if you call "MAUSNET" a hacker network. In "MAUSNET" all major serious software-developers are present and support their products. The "MAUSNET" is well known for serious information; the Alwin-Stumpf mail is simply an accident.

> modem? Is it real fast like Flash 1.6, i.e. can it keep up
> with the data without handshaking constantly?

Yes, if you remove all the window gadgets, move bar, vertical, and
horizontal scroll bars, and use the supplied gdos fonts, you can get 25
lines, and with NVDI, at 14400, it scrolls fast enough, I can't keep
up reading in ascii mode. Fancy vt100 graphics slow things down a bit.

I used Flash for years, then Interlink, then went back to Flash.
Always had Shadow with flash, but Shadow needs upgrading to zmodem, so I
tried and liked Satlker 3 enugh to buy it. You need to be up to at least
3.02, the current latest, as it fixes several annoying bugs in the
original 3. There is a script login writing script to help for those who
hate script languages, nd the scrtipt language is based on C, which I
personally prefer to basic, but then I never learned basic. I use
nothing but Stalker any more, except Hermes uucp, and can't say enough
good things about it, though if CoNNect could run as an accessory, and
transfer in the background, it would be a close race.

The reason high officers are essentially never official spokespeople is that nobody controls them. I hope you don't remember what company I work for.....I can't tell you how many times our chairman has bragged in public about new products which never got introduced. Rank has its privileges, and one of them is being allowed to mouth off. The reason a statement Bob Brodie makes as Atari's spokesman is believable is that his responsibilities include checking the accuracy of his statements up and down the line. My employer makes most of its official announcements in advertising, but we also have about 2 official spokespeople, and they check their statements VERY carefully because that's what they're employed for.

Well, when I bought STalker3, it came with some GDOS fonts, namely a couple of IBM-ish fonts and one called PC-ANSI, a small font similar to the icon font, but easier to read. This works great on my TT.

BTW, about GDOS speed. I only have a 2400 baud modem, but I find that GDOS keeps up pretty well UNLESS the remote computer sends a screen clear. This is slooooow.

>Is this the 50/60 mhz output thing?

>Mike

Yep, this program runs in 50 Hz. On older American TV's, this will probably
work fine (with some minor adjustment in the vertical hold).
Newer TV's have more sophisticated synchronization circuitry so that no
vertical hold adjustment is necessary, but this makes it impossible to
display 50 Hz output on them.

Try a TV with a vertical hold knob or an Atari monitor...

Is this really possible? I have a 2M TT (I really want more) and have tried GCC without any success. Even "hello world" won't work. I think I have all the libraries, etc., that I need, but I always get (from Gulam) "Cmd exit code -1" (or something like that, it's been a while). I just figured I didn't have enough RAM, since I heard GCC needs 4M. But is there some way I can get it to work?

> 'original' Flash (latest Alan did was 1.6...right!) Does Flash have VT200?

Are you sure you need vt200 rather than vt102 (which is vt100 plus advanced video features?) I've seen a lot of people asking about vt200 and vt300 emulation when all that's required is vt102, or often just vt100. Flash 1.6 vt100 emulation is very good for Unix etc., but not as complete as Uniterm when it comes to advanced video (like double height and width characters, bolding, etc.), which is used more often on VAX/VMS machines. However even Uniterm doesn't do all of the advanced vt102 stuff like blinking text for example. This is not even vt200 stuff.

So, it would be a better question to ask what video features you require, rather than just "vt200", which is widely misunderstood, is what I was trying to say. :)

My vote goes also to ICE Packer v2.40... I think thats its much better
then PFX since its FREE! and I can also pack my DATA files. Saves lots
of space and Revenge Document Displayer can read ICE Packed text files.
Also Unpacking source source code is provided and it works nicely on
GFA Basic for DATA files.

>or use it in a "multi-task" environment, like Connect. BUT the screen updates
>are MUCH faster than Connect. I don't like slow screen display, thence I
>use Uniterm...

Hold on a sec. Unless Uniterm has been updated recently, it supports
vt200. It may support some of the functions of vt220, 320, etc. but they
aren't mentioned in the program (I don't remember hearing about them in the
manual, but it is possible...). It does support the Tek4014 though.

You are right, the updating _is_ faster, but you lose compatibility -
it will probably break on the Falcon, and it definately will break in a
multitasking environment. Connect's strength is that it uses GEM. It's
weakness is that it must depend on slow GEM (VDI) code, unless you have a
screen accelerator, and then it flies!

>P.S.: I use a Mega 4 computer. Maybe with a TT the screen updates are faster
>in Connect. I don't care... but you might!

It does. I do. :)

>P.P.S.: Uniterm supports up to 132 columns by 50 lines, if you need it...
>but the characters are a bit small.

Connect supports a 8 pt font that should give you more lines than you
need, but it is hard on the eyes, just as any small font (like in Uniterm) will
do. Actually, Connect has several font sizes 8pt to 40pt.

-Mike

5161. Connect ... what is it?

Newsgroup: comp.sys.atari.st
Date: 1992-11-06 03:04:23 UTC
From: baffoni@aludra.usc.edu
Message-ID: <1dcnbnINNe2b@aludra.usc.edu>
Source record: 215227

Wolfgang asked me to post this for him.
-MikeB

Hi,

With all of the posting going on about the various terminal programs (STORM, STalker, etc.), several people have asked me to post about my terminal program CoNnect, so here is a discription that should help to compare/contrast between them.

First, I would like to point out that CoNnect nearly fulfills all of STORM's promised features. Internal multitasking, multitasking down/uploads using GEMRZSZ.ACC, vt52 through vt220 emulation and so on.

Features missing in CoNnect are the editor (which will be developed soon) and the Basic-Interpreter. From my point of view a Basic Interpreter is less flexible than CoNnect's CoSHy, the internal Unix-Shell compatible Script language, which you can use to access your remote's and the host's system from one commandline. Constructs like loops, branches and functions can be done using CoSHy as well as any basic interpreter. In conjunction with the powerfull tools available with MiNT (ls, cat, awk, sed, ...) which can be accessed directly from CoSHy's commandline or from scripts, this script language, which can also access CoNnect's terminal capabilities, is one of the most powerful tools available in terminal programms so far. In addition to this, CoNnect is able to learn from the user's activities and produces CoSHy scripts to repeat e.g. news polling, login procedures or program up-/download.

In contrast to STORM, CoNnect supports the terminal emulations vt52, vt100, vt102, vt220 in nearly all proposed features. 132 colums are implemented as well as bug free scrolling regions, soft scrolling and double sized characters. CoNnect has no problems passing the 'vttest' programm _completly_. Even Uniterm shows bugs in 'vttest'! The latest version of CoNnect even supports TEK 4014 and allows correct GEM Metafile output (EZGEM is not necessary like in UniTerm). CoNnect supports both the TT's and MEGA STE's special modem ports on baudrates of 38400, 57600 up to even 153600 baud.

Several sessions on different ports (including MIDI) can run simultaniously in different windows.

CoNnect is completly based on GEM. It allows you to use GDOS fonts with or without GDOS. Fonts are added to allow terminal sizes of 25x80 even with scrollbars in the terminal windows.

Screen accellerators like WARP9 or even better NVDI are recommended to compensate TOSs slow VDI. CoNnect allows the user to set or unset scrollbars, to set or unset the ANSI-Statusline, to define up to 80 function keys which can be installed for sending text or starting CoSHy-Scripts (e.g. start an external editor or and automatical download by a definable function key).

CoNnects automatic dialer can store as many numbers the system's memory allows. Seven numbers can be selected to become dialed in a loop until a successfull CONNECT. All necessary modem parameters can be defined for this dialer. The user can define login scripts for each number separatly.

For ZyXEL-Modem users CoNnect has the capability to act like an answering mashine which can be upgraded (using CoSHy) to build one's own VOICE-mail. This answering machine requires at least one port running on 38400 baud (like MODEM2 on MEGA STE or TT).

In conjunction with MiNT/MultiTOS CoNnect offers a lot of new features. All dialogues are placed in windows so as not to desturb the multitasking progress. Several shells (like bash or tcsh) can run in different windows simultaniosly in addition to the normal terminal action. CoNnect is also a MiNT-aware terminal program which means the slow Bconin() or Bconout() routines are tabu when running unter MiNT/MultiTOS.

If you have any problems you can get quick help from either me or Mike Baffoni (baffoni@aludra.usc.edu) via normal Internet mail.

And the best. CoNnect's price is nearly half of STORMs. Only $40,- for this shareware product.

- Wolfgang Wander

Hi,

First, I wanted to thank you Jeff N' Co. for the work you have done,
are doing, and will do on a.a.!!! Thanks for explaining the effects of being
on afs. BTW, could you describe how to mount it from a UNIX station (if
that is possible without having a normal account)?

Second, I assumed that we could ftp new files to the New directory
like we did before. However, I have been having problems - when I type
"put conn177.lzh"
I get the response:

"200 Port command successful.
553 conn177.lzh; EDOTDOT!!!!.
ftp>
"

Am I doing something wrong? Is ftp uploading disabled? Has my
Unix station gone stark raving mad?

For those who are interested, the latest version of CoNnect (1.77) is
now available at ftp.uni-kl.de in the pub/atari/telecom directory. I'll put
it up in a.a. as soon as I get these problems fixed. (you won't be able
to dl tho until Jeff N Co get to it!)

Thanks for any and all help.

-MikeB

In a previous post, Karl Anders Oygard said:

>I saw a Mega ST equipped with a 60MHz 68040 accelerator board
>when I went to the Duesseldorf Atari Fair last summer. Unfortunately
>they wouldn't let me test it, so I couldn't comment on the speed
>increase a such board would give.

Does anyone know if a English translation of the article will appear?
Is the article in English (or German as I would suspect)?

If it only appears in German, would it be possible for someone to
post a translation, or would that cause too many problems (copywrite, etc.)?

>> Same as above with ICD Link 535 dollars

>And you said the 21mByte disks are supposed to be how much??? That
>sounds like a killer deal!

Don't forget that a Floptical is NOT superior to a hard drive. They give
one 1/4 of the transfer speed, and the seek-time is MUCH worse. The biggest
advantage is the cheap and removable media. It is DEFINATELY the successor
to the floppy drive (as NeXT has concluded). NeXT machines generally
transfer files to the hard disk for any work.

Has anyone tried the 'Overscan' modification on their ST... If so, was it worth the trouble, and what advantages does it give.

Also, is the EPROM-TOS v1.4 Patch necessary? (Is EPROM-TOS any different from normal ATARI-TOS 1.4 or is it the same but an alternative name!?)

I have all the Info' files/pictures (most of which are in German which is of little use to me, as I can't read German). And any info would be appreciated!

>I agree, a "standard" buss would be great to have..
>Unfortunately, the Atari implementation of the VMEBUSS is about
>as standard as the Atari implementation of the SCSI buss was
>on the ST..

Bob, play fair. The 3u has many cards available for it, in highly specialised fields, like instrumentation, data aquisition, etc, etc. ot to mention at least one colour board in North America, who knows how many in Europe. You also don't know how many specialised lab or research applications specifically writen for the STe are in use around the world, where VME cage systems are not a financial option for peoples budget. The old ST World used to do articles on people using ST's for research aplications in the UK, while STart was running covers of people using their ST to managge a lemonade stand.
What you really mean is how many "Joe six pack'ers" have found usefule VME cards for their mega STe's. The answer is obviously, not very many. However, anyone who had done their homework would know the cost of p[roducing a VME card is fairly high. Why no one has seen fit to write drivers for some existing VME product is obvious to anyone looking at the North American market. Perhaps somone in Germany knows of a company who produced a commercial product based on the VME bus.
But calling VME non standard, is rediculous. VME is widely used for highly professional applications, which would make you wonder why Atari thought it would be a good bus for their machine. I'd guess, again, they were influenced by someone in Europe, where it would make sense. Over here, all it did was lost us the benifit of digidesign's Soundtools, as they didn't feel sales warrented building a completely new card for the Mega STe.

However, I do completely agree with your next post about corporate presidents not making official announcements. But then, you have also had a case where it wasn't a good idea to take a countries vice president's statements too seriously. Maybe it's a new trend.

I have used the programm bigscreen before I got my TTM195, and it worked
as you expected. (I also used it for Calamus) But it is more convenient,
if you have to money, to buy a 19" monitor.

hmm, okay. At the Glendale Fest in September, I asked BOB BRODIE,
"Official Spokesman" if you will, about the release of the Falcon. He
corrected me when I implied that the rumors were that the Falcon
really wouldn't be available till '93 in America. He said, and I
paraphrase, that the Falcon would be available at dealers in America
in late October like they had been saying. This is almost a quote.
He didn't say which dealers.

Good enough?

So who got them. Or was it too difficult to get the Falcons to
dealers on that schedule. My further understanding from Bill Rhebock,
was 2 Falcons at some dealers end of Oct. More Falcons in Nov and
Dec. And full production by Jan 93.

As far as I know the author is only to be contacted via Fido or Network.ST.

DM> I'd like to see a MIDIport option to maximize the speed of transfer when
DM> the computers can be directly connected and to save the hassle of
DM> disconnecting the serial cable. I would just leave the MIDI cables
DM> connected all of the time and only have to run Jekyll on each computer to
DM> movefiles between them. I'm sure this would be quicker than using
DM> floppies. Any other ideas on how to do this at minimum cost?

Better try MikeNet (Shareware - SWfee 25 US$, I think). With it you can
directly link drives between both computers.
Its DISadvantages are:
No file locking (up to now, the author is working on it)
Only 2 computers can be connected (the author will start working on this
topic in some time coming)

Advantages:
Can be used to redirect drives of both systems (remote C: to local C:,
local F: to local G: ...)
Redirecting drives can be done via command line.
Works in background...

Until you pay, your setup cannot be saved though...

I'll upload Mikenet to a.a in the next few days...

bye,
Benedikt

| Hi,

| I am looking for an nroff formatter, or better still a full un*x style
| man utility, so that I can read nroff formatted man pages under MiNT.

| If anyone could point me in the right direction I would be most gratefull.

| Many thanks in anticipation,

| Rob Thompson, robt@inmos.com

There are two possibilities.

1.) The nroff-clone by Bill Rosenkranz.
This tool is available from atari.archive.umich.edu. It is only subset of the original unix nroff, but does quite a good job on manual pages. Bill also wrote a 'man' and a 'manpager' command, so can organize you manual pages as under unix. I believe the last version is 'nroff121b.zoo' and appeared on comp.binaries.atari.st.

2.) groff from FSF.
Erling Henanger ported groff from the FSF to the ST. This is a full blown nroff clone offering more functionality the original nroff/troff combination. The preprocessors eqn, tbl and pic are also available. groff has backends for several output devices: ascii, TeX-dvi file and postscript. The diff for groff-1.05 are available from atari.archive.umich.edu, but when I looked through the diffs I didn't notice any Atari specific line of code. Therefore it should be too difficult to port groff-1.06. I don't know if the binaries are available anywhere.

While Bill's works nicely under plain TOS, groff depend more heavily on MiNT, but I assume it would also run under plain TOS as long as you organize the pipes by through temporary files.

None of those adverts are from Atari, which is true to form for them. Lots
of dealers are happily accepting advance orders for machines that are just
plain not available.

I amd hearing reports that Atari UK will only be shipping limited numbers of
4Mb/65MbHD machines before Christmas. 1Mb discless machines will not be
available until January at the earliest. This is a typical Atari UK cockup.
They will totally miss the Christmas season which Commodore are trying hard
to get sales from with their new A1200(?). Will Atari ever learn? I think not.

Message-ID: <1992Nov6.103537.42534@urz.unibas.ch>
Source record: 215216

Hi,
I`d like to know if anybody has seen the Falcon in a store yet?

According to Atari it was supposed to be for sale already, but
then that`s nothing new - when was there ever a time when you could
rely on the dates given by atari ?

Could it be, that they are having trouble with the MultiTos and therefor
can`t - after having said they would - bring the Falcon with it on market ?
The Falcons Atari gave to programmers, etc. only has the
single task system Tos 4.0, ergo troubles in the Atari lab ?

Yes, it can.
Save the files in an IFF format - use Picsitch or similar.
I believe the NeoChrome Master allows direct IFF saves.

You can now load these onto the PC using Graphic Workshop.
GW supports GIF, BMP, IFF and many other formats.

I've done it this way, but sometimes the colour converter doesn't
quite match the colours properly.

Antony.

>trying to say. :)
>ken@isgtec.com [...!uunet.ca!isgtec!ken] Ken Newman

(To be facetious...) Personnally I would prefer vxt2000 emulation on
my Mega STe.... But since that's an X-terminal.... :-).

Anyway....

The last time I tried CoNNect it kept crashing.....

With Uniterm I was able to define the function keys to act like the
function keys and other miscellaneous keys on a vt220 terminal. VERY
necessary if you are doing anything serious with VAX/VMS (I'm the
All-in-1 manager/application developer at my site & the tools
available for this are too cumbersome on anything less than a vt220)

The real question/comment:

Are people looking for vt220+ functionality or do they just
want a vt220 style keyboard ? (LK201 or LK401) ??

>I no longer have the 40 folder problem (correct???).

No 40 folder problem. You will need POOLFIX3 or Claus Brod's update of
POOLFIX3 which was called POOLFIX4, but has had its name changed... There is
also TOS14FIX, to fix a few other minor problems.

>But what serial port problems do I still have,

You still have those RTS/CTS problems, and problems with driving the serial
line at high speeds. There are patches to fix these problems on
atari.archive.

>and what about disk
>routines? I now have a megafile 60 and normal internal 720 floppy. Do I
>still need fatspeed (guess not). And what book describes the changes?

You don't need FATSPEED any more. TOS 1.4 disk access speed is far, far
better than that in TOS 1.0

>I have a good book that describes TOS 1.0 completely and part of TOS
>1.2 but I heard TOS 1.4 has some extra systemcalls like Mxalloc.

It depends on which languages you can understand. There are some excellent
German texts, and you could read my TOS 1.4 description in a previous edition
of the UK mag "ST Applications" :-) There is no new Mxalloc system call --
that came in later versions on TOS.

Source record: 214969

I think I can safely say that we are venturing into 'Atari Time' which bares no relation to ordinary time. This happens with most computer manufacturers who try *HARD* to produce quality products. They announce a product release in two months which actualy means two ATARI-months. This can be from 4 to 6 real months.

When I heard that atari were releasing the Falcon this Autumn I put my money into a 6 month investment scheme because I knew I wouldn't be able to get one until Spring 1993! I suggest everyone else puts their pennies into similar schemes (perhaps 90 days or so!) You money will work better for you that way.

Oh.. When is the 386SX expansion card going to be available. Unless Monkey Island II comes out for the Falcon I may need one of these :-).

Of course :-)

Get a copy of View Gif 1.2 (should be at atari.archive.umich.edu among
other sites). Will let you convert between Degas and GIF's (MAC as well,
if you're in high res)...

>weakness is that it must depend on slow GEM (VDI) code, unless you have a
>screen accelerator, and then it flies!

I dunno if it will break on a Falcon, but Uniterm works fine under
a Multitasking environment (MultiGEM in particular). Of course, you
should only have it running as the sole term program because it
only accesses modem port 1 (whereas ConNect does let you use up to
3 modem/serial ports and the MIDI port). Both term programs work
well on my MegaSTe/Warp9...

[stuff deleted]

>>P.P.S.: Uniterm supports up to 132 columns by 50 lines, if you need it...
>>but the characters are a bit small.
>
> Connect supports a 8 pt font that should give you more lines than you
>need, but it is hard on the eyes, just as any small font (like in Uniterm) will
>do. Actually, Connect has several font sizes 8pt to 40pt.

A definite strength of ConNect is its use of GDOS. However, the one
thing that Uniterm can do that I have NOT seen other term programs
do (on the Atari or IBM) is full VT100 emulation (i.e. actual
DOUBLE-SIZED characters (double height/width, single height/double
width, single width/double height). If anyone has found any other
term programs (ST or IBM) that can do this, let me know...

One thing I do like about ConNect is the use of multiple ports for
communication. This way, I can leave my modem plugged into modem port 1,
and my null-modem connecttion to my 286 on modem port 2. No moving around
wires or getting a RS232 switch box...

While I think that Dareck's attitude is terribly cocky (so am I
at times), I do think it is a very interesting achievement to be
able to emulate an ST on a completely different platform.
PC Ditto suffered from the same kind of speed penalty when it
tried to emulate a 8086 PC XT o the ST.

Chris

5190. Keynote Chameleon problem

Newsgroup: comp.sys.atari.st
Date: 1992-11-06 14:36:24 UTC
From: kevinb@syma.sussex.ac.uk
Message-ID: <1992Nov6.143624.23708@syma.sussex.ac.uk>
Source record: 215036

I have a problem with the MIDI Sysex librarian programme 'Chameleon', in that it crashes (with 2 or 4 bombs) whenever I try to get it to access partition G of my hard disk drive (ICD mechanism). This happens with both versions 1.0 and 1.1 of Chameleon. Since Keynote's telephone number gives the "unobtainable" tone nowadays, I would be grateful to hear whether other users of Chameleon have come across the same problem.
Thanks in advance.

5191. HP Laserjet graphics/dl'able char generator programming

From: strgh@csv.warwick.ac.uk
Message-ID: <1de1pmINNrvs@violet.csv.warwick.ac.uk>
Source record: 215247

Does anyone know if unzip 5.0 is available for an ST? - the last version
I've seen is unzip 4.1 (I think).

I ignored the lha/lzh/arc/zoo/zip wars of a few months back; was any
consensus reached about the most appropriate compression method for ST's?
- I mainly want to compress & uncompress directory trees for shuffling
between Unix, an ST, and an IBM-PC, and zip seem easiest for Unix<->PC.
Many thanks,

==========

January 15, 1992

Atari Corporation Official Announcement

I am pleased to announce that Atari is making all of the released TOS development information available to the general public. We are making the kit available to fulfil the needs of programmers that already have purchased a third-party development package, Atari owners that are curious about the 'nuts and bolts' of The Operating System, and anyone else that wants to have a detailed understanding of TOS software development. If you wish, you may purchase the entire kit for $150.00 (U.S.) and also get one year of technical support from Atari via the private Atari Developer Roundtable on GEnie, 6 issues of the bi-monthly Developer Newsletter, ATARI.RSC, and one year of on-going developer kit upgrades. If you wish to renew after one year, there is a fee of only $40.00.

If you wish information on only certain aspects of Atari TOS computers, we also sell sections of the kit separately. The items that are available range from every issue of the developer newsletter since 1985, to the release notes for the exciting new STBOOK. Every detail a software or hardware developer could want is outlined, including MegaSTE/TT VME Bus specifications, STE DMA sound, FSM GDOS programming information, and more. Please see the order form for details.

You must purchase the $150.00 full kit to be eligible for on-going support. I'm sorry, but at this time, you may not purchase a part of the kit, and later "upgrade" to the support level.

Developers that are currently not registered with Atari, and have a commercial product on the market, or have a product in development, or have any other special needs requiring direct unlimited telephone support should sign up under the Atari Commercial Developer Program. There is an additional fee for this program, but there is no renewal fee required as long as you continue product development and support.

(Educators, universities, and businesses may fall into this category.)
Please contact Gail Bacani on 408-745-2022 for more information
on the Commercial Developer Program.

The complete order form follows, outlining all of the documentation
that is available. Please note that several items include disks
containing software relating to the documentation. We want to assure
that you get the most out of your Atari Computer experience!

Sincerely,

Bill Rehbock,
Director of Technical Services, Atari Corp.

>Mint/Toswin.

sorry if it sounds stupid, but did you set $TERM and have an entry for
that in /etc/termcap? (i have put mine into the readme.)

or maybe it couldn't find the /etc directory... i think the termcap
library looks for it on the `current disk' i.e. in /etc not u:/etc.
if its that try setting $TERMCAP to either the `absolute' filename like
e.g. /dev/u/etc/termcap (u:/etc/termcap wont't work) or to the
description itself (thats why u:/etc... doesn't work, then it thinks
its a description). or set the rootdir in $UNIXMODE, e.g. with
UNIXMODE=ru all filenames starting with / get translated to u:/ thanks
to the MiNT libs.

oh and with toswin it probably works because toswin sets $TERMCAP
to its own description itself... (unless you turn that off.)

>Bob Malay
hope that helps (and my english wasn't too strange :-)

C'mon Roger, while I must agree with your hidden meaning as to the "usefulness"
of the Gemulator, you could at least try to answer the poster's question.

Fred, try Paragon Computers in Perth, WA. Sorry, no phone number but you should
be able to get it from directory assist. If they don't have the Gemulator, then
I doubt that any others in Oz would. You could of course order it from the US
but you might be faced with a stiff tax upon receipt. Best read the reviews
before you buy one anywhere, however.

How can Atari be competetive when it can't even get the product
to the public!? This is a problem that Atari is suffering from:
Too little too late. When I bought my 1040ST it was only after I
got fed up with waiting for the Mega. Now I want a Falcon, and I
can't get it. If Atari had masses of Falcon030s to sell to the
US market RIGHT NOW, they would sell like mad in the music and
home markets (lots of power for the buck AND a DSP). But by the
time it is widely available, it will be too late. NeXT and Indigo
already have DSP's and I think Apple is working on it. Also, 68040
computers arwe the wave of the _present_! Atari, as usual will get
blown away by better technology from other manufacturers who can
deliver on time. I read lots of rumors on this newsgroup and on the
Macintosh Hardware newsgroup, and the difference is that the Apple
rumors come true. Apple was working on the Mac IIvx, Duos, and new
powerbooks for release on Oct. 19, and they were all released and
available on Oct. 19. With Atari, there is always agonizing frustration
for the customer waiting to get his hands on new machine. Unless
Atari can ship faster, it will ALWAYS be behind.

JH> recognise the extended command set. You have to get an adscsii pro

Oh, I don't know about that. I had a Quantum105LPS running quite
nicely on my 520ST with ICD ADSCSI (circa '88) rather nicely. That of course
was before I got my TT, but the point stands that it worked fine for me.
However, I was scrupulous to keep up with the current drivers.

>between Unix, an ST, and an IBM-PC, and zip seem easiest for Unix<->PC.

ST Zip 2.0 (available at atari.archive and others I believe) will handle files that unzip 5.0 will handle (i.e. the latest ZIP version with the higher compression).

As for compression methods, there's versions of ZIP/LZH/ZOO for Unix/ST/IBM & others. Personally, I keep things in LZH mode, as it has the best compression (other than the new ZIP, which is a little better). But at the moment I'm not about to convert ALL my files from LZH to ZIP (was a trip eough converting them from ARC to LZH, though worth the effort)...

>in-the-world-uses-it expansion method.)

I have to disagree. A PDS is the only way to go for CPU upgrades or other products that require a 0waitstate operation within the machine. What good would it be to have a 50MHz '040 if _every_ access to main memory incurs one or more waits? I agree that VME is a good bus architecture - 1WS incurred very fast, and with the larger bus (6U) it is accesses about everything the CPU can. The point is that not everything is appropriate for an external bus like that. True, you don't want to put your graphics adapter in a PDS (unless, like the Falcon it is the only one you have :( ) but you don't want the '040 in the VME either.

>VMEbus is not very different from what you'd have to cram into a processor-
>direct slot. The difference in bus control/arbitration additions is negligible
>now since you can get single-chip VME bus interface controllers and such.

One waitstate (80ns or less) doesn't sound like much...until you try to access memory. It is questionable whether a VME based DSP/sound sytem would do well, besides lacking the ability to bus master (on the Atari, not the spec) so that sound DMA to the DSP or other chips (like DAC/ADC) would be impossible. I am not saying that you couldn't transfer to those chips very quickly - bandwidth to the 16-bit/8chnl ADC/DAC would only be max 800k/s, but that is not insignificant even on the TTbus, let alone the MegaSTe bus. However, a PDS based DSP/sound system would definately work (if the PDS supported bus mastering, all data/address/interrupts). Too bad the MegaSTe and the TT don't have a (decent) PDS.

>Of course, you don't need to put *everything* on the VMEbus. It still makes
>sense for system RAM and ROM to live on a private bus, just like the way STs
>and TTs already work. But you could stick myriad enhancements on the VME -
>graphics boards, custom coprocessors, ethernet network controllers, serial
>port multiplexors, etc. etc. etc... VME is definitely the best way to go.

Agreed. For those (relatively) low bandwidth applications.

Gee... is it _that_ time of the month already? Roger, your monthly diatribes on the lack of Atari support are surely heart-rending, but tiresome as well, I'm afraid. Yes, we all agree that Atari "support" <snicker> leaves a "little" <chuckle> to be desired and we all know (thanks to your periodic reports) how tough it is to get _any_ support in NZ or Oz. And we sympathize with you... really we do!

But... to claim someone needs psychiatric help if they decide to stick with Atari is a little much, don't ya reckon? Hey, we all know you love your new PC. Good for you. Why not just leave it at that, eh mate?

BTW, during your lengthy (and expensive) phone calls to the folks at Paragon, did you ever speak with Phil? He's the owner, ya know, and maybe he can get some results for you. Have not heard from him for quite awhile, however.

Anyhow, good luck to you, Roger. But lay off the rest of us, OK?

Cheers,

In article <2327976@overmind.citadel> undermind!Steve_Johnson@overmind.mind.org writes:
>HiSoft (I believe) and a few other companies have developed or are developing
> 65,536-color paint programs for the Falcon. Lexicor also has a new program
>called Phoenix512 (or something like that) which will, I believe, do Spectrum
> pics on normal ST's and up to 16-bit color painting on a Falcon030.

To add to what Steve said, HiSoft is developing a package called True Paint,
which will allow 16-bit color painting on the Falcon. This product will
be distributed in North America by Oregon Research Associates, who distributes
and supports the other HiSoft products here as well as their own Diamond Back,
Diamond Edge, and Ultimate Virus Killer (actually UVK is imported too
I believe).

As I understand it, Lexicor's Phoenix512 will render Chronos' ANM animation
files in 512-color Spectrum512-compatible files. This will allow users to
use their software on low-end ST, STE, MegaST, and MegaSTE machines that
don't have graphics cards. They are also developing MonaLisa, a true-color
(everyone's favorite term :^) paint package for the Falcon. I believe that
they are also developing it for the Silicon Graphics machines already;
Lee Seiler actually showed it running on an Indigo at the Glendale show.

Finally, for those interested in graphics cards, George Richardson, the
designer of Gadgets by Small's SST board, is going to be finally developing
his Chromax card. It will be available the MegaST, MegaSTE/TT (VME), SST,
and Falcon. If you have a 520 or 1040 and want one, you must speak up. :^)
He hasn't ruled them out, but he needs to see sufficient demand for them.
He's assembling a mailing list now. I know his address on GEnie is
G.RICHARDSO1, but I don't know if he has a CompuServe address. For more info,
check out this weekend's Z*Net (hopefully it will be released this weekend! :^).

Can someone recommend an accelerator board which allows for the installation of a math-coprocessor. Also of interest is one which has capacity for additional memory. Do-it-yourself projects are also of interest provided I don't have to produce my own Printed Circuit Board. It is for a an 520 STfm which has already been upped to 1Meg on the motherboard. What have people used that is good and what is bad. I also do not have unlimited money to spend (who does?).

Regarding 80 columns in a window with STORM...

STORM already uses a custom font that allows full width lines in a GEM window...

Regarding VT terminal emulations.. Alan Page is adding features as fast as we can browbeat him into it.. right now his priority is adding more download protocols, but other terminal emulations are "in the works"... AND, Storm is already far and away more powerful than UniTerm...

Hi Frank!

>As I know the newest version is the 4.17 and there will be no newer
>version because it got a commercial product.

This is right! The name of the "new" Version is "toXis", it costs 69,- DM.
Sagrotan 4.17 is more than 2 years old, buggy and will _not_ recognize the
most known viruses. It has also an absolute useless analysing routine for
suspicious/unknown boot disks. - And it works very slooooooowwwwwwly.......

>I've heard something about sakrotan (instead of sagrotan).
^^^^^^^^
This name had been used for a while, because it exists a chemical detergent in
Germany, with the name "Sagrotan". For that reason, a german public-domain
dealer has changed the name into "Sakrotan", to prevent any litigation with the
trader of this detergent.

>What is your favourite Viruskiller?

;-)))

Try one of these: UVK 5.6 , Poison! 1.73 (Version 2.0 is comming soon) or
VIRENDETEKTOR 3.1g

```

~ October 1, 1992 ~

The STORM! I cringe when I look at the original Flash. It was written
"""""""""" years ago and I actually learned to program in C by writing
Flash. The editor was a real hack that dies with large files. Much of the
the command language was thrown together and not properly designed. Once
we had started, we had to stick with what we head. The continuing
popularity of Flash never fails to surprise me.

I've had a chance to learn a lot more about programming since then,
and I've been exposed to MSDOS and Windows and picked up lots of new ideas.
The LAST thing on my mind was to 'improve' the old Flash! There isn't one
line of code from the original Flash in Storm and Storm doesn't look at all
like Flash.

First of all, the editor has FULL word wrap. That means when you
backspace or delete, the words wrap up from the previous line. No more
deleting carriage returns and hitting the F10 key. Of course, the editor
window is resizable and movable. The editor is just as fast with a 5,000
line file as with a ten line file. You can have as many editing windows as
GEM will let you have. You can capture in one window while editing in
another. If you're running at 9600 baud, there's no point even having the
terminal window open. Just close it and scroll through the capture at your
own pace.

Second, Windows(TM) style dropdown menus. Hit ALT-F and the File menu
drops down. Use the cursor keys to move up and down through the menu
items. Hit Return to select and item. Use left and right cursor keys to
move to other menus. Each menu item has a character underlined which you
can press to select that item. e.g. 'O' for Open in the file menu. I have
tried Windows, and it's a whole lot easier to remember menu items this way
than remembering weird combinations of control-alt-right-shift. However,
if you move the mouse into the menu bar, it's a regular GEM menu bar. I

don't use any undocumented variables or other tricks. It's 100% documented GEM calls and works just fine with MultiTOS.

Third, Basic. Throw away all your DO files. I can't believe that Flash II resurrected that poor excuse for a macro language. We never thought we would expand it to the degree we did. I kept bolting on new features, but it got tougher and tougher each time.

Basic is interactive. You can trace, stop, resume and otherwise debug the program much more easily. Also, Basic programs get syntax checked when you enter them, not when you run them. Basic has powerful string functions, arrays, math, and event trapping.

P.S. Antic went under probably owing me thousands of dollars that I will """" never collect. My last royalty payment was in the summer of 1990 I believe, and even that was way overdue. If anyone has bought Flash in the past 2 1/2 years, I haven't seen a penny from it. I was in England while all this was going on, and not able to do much.
(A.PAGE3, CAT30, TOP14, MSG:9/M475)

Well if any of you wish to contact Alan Page I can foward the Mail him on GEnie so e-mail what you need to say to me...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Hello everybody!

I am looking for non-commercial (= PD/SW/FW) Calamus fonts. There are
some at a.a.u.e, but I would like to find more.

If you know any location anywhere on this globe that has Calamus fonts
available via FTP (or other net-access) or Hi-Speed (at least V.32)
modem, please share the information and tell me about it!

Try GSZRZACC.ACC or XYZ.PRG. GSZRZACC is very good but as I know there
are only registered shareware copies of it. XYZ should lay on many
ftp-servers (e.g. atari.archive.umich.edu).

5231. Quantum 105LPS on ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-07 18:33:26 UTC
From: jeffy@syrinx.umd.edu
Message-ID: <16876@umd5.umd.edu>
Source record: 214957
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm trying to get a Quantum 105LPS to work on my Atari ST. It's an original 520 with TOS 1.0. I'm using a Supra Host Adaptor (one of the early ones, from ~'88, before the clock chip and DMA passthrough were added). Software is Supra 4.03, from 1990. I've got my original ST138N Seagate drive set for SCSI 0. The computer would not recognize the Quantum at 0 or 1 (0, obviously, was tried with the Seagate out of the system). The drive will boot and supposedly format at SCSI ID 4, but data is not being written correctly to the Quantum.

In addition to the 3 jumpers for ID select, there are 3 other jumpers, labeled SS, EP, and WS. As the drive did not come with a manual, I have no idea what these are for. With EP set, the drive is not recognized. With SS set, the drive went into a continuous seek and was not recognized. With WS, the drive would not power up at all.

Has anybody gotten the Quantum to work correctly with the Supra H/A? Is there something obvious I've missed here?

Any help would be appreciated.

Jeff

My personal opinion is dump the Supra and get an ICD. But then I'm
not the one who needs to shell out the money... :).

>In addition to the 3 jumpers for ID select, there are 3 other jumpers,
>labeled SS, EP, and WS. As the drive did not come with a manual, I

>With SS set, the drive went into a continuous seek and was not recognized.
>With WS, the drive would not power up at all.

Don't put any jumpers on SS, EP, or WS. SS is Self Seek - its a test
mode that the factories use to test the stepping mechanism of the drives
(or so I have been told - I still don't understand what significant data
can come from this test other than the heads move - not that they go to the
right track, or experience track drift, just that they move. <shrug>). EP
is Enable Parity. Don't use this as the atari does not use parity for its
I/O streams (well, at least none of the host adapters I know of do). WS
is Wait to Spin. Basically it is an option that makes the drive wait to spin
up until it is "woken" up by an appropriate "wake up" signal from the SCSI
bus. I think some Macs may have this capability (but I have never known
a Mac (let alone any other computer, except maybe an XT :) that you would
actually want to start the drive wakeup _after_ you start the machine as it
generally takes longer for the drive to reach speed and initialize than it
takes most machines to do their memory check and request info from the HD).

Look, if the drive doesn't work at ID=0, in all likely hood it will
not work with that setup. I believe the ID=4 is a fluke. Good luck anyway.

From what I've heard, you are completely wrong here. Appearantly,
when the program came out, the author got so many registrations, he was
running 2 months behind shipping keys.

Better get in touch with Supra. I know when I got my 52lps, my old
ICD host adapter, even with the rom ugrade, wouldn't work with the lps. I
ended up having to buy an ADscsi pro. I think the lps uses some of the
newer scsi commands that these old boards don't understand.

5238. SM124 problems

Newsgroup: comp.sys.atari.st
Date: 1992-11-07 22:40:49 UTC
From: cs2320ak@utagraph.uta.edu
Message-ID: <1992Nov7.224049.16018@utagraph.uta.edu>
Source record: 214997

I looked in the FAQ but couldn't find anything about this. I know I've heard just about everyone who owns an SM124 monochrome monitor complain of this problem, which is when the background is all black using white characters or graphics, the brightness of the characters fades to near nothingness. I would like to know if there's something I can do about this problem, as in getting it fixed for cheaper than a new monitor would cost. Is this a design flaw? Thanks in advance.

>VME either.

I certainly wouldn't put a processor upgrade out on the VMEbus. Nor would I
put it in a PDS; I'd pull out the old processor and put the new one in the
vacated socket... The PDS is completely useless for this application anyway
(if we're talking about the Falcon) since it only provides a 68000-style
A24/D16 interface. (Of course, no matter what you had, it would be pretty
tough to upgrade a <=68030 system to 68040 since the '040 doesn't support
an asynchronous bus...)
>
>>VMEbus is not very different from what you'd have to cram into a processor-

Like you say, nothing rules out putting a decent DMA engine on a VME device.
Also, you seem to be overlooking the possibility of block-mode transfers
when you keep referring to that 1 wait-state.

I think it is a design flaw. Every SM124 I've ever seen does it. When I had mine, I could turn the brightness and contrast all the way up & then I could see it, but on my parents', the knobs don't go far enough. Pretty lame!

I have downloaded UE311DOC.ZOO twice now and it was truncated each time. I happily extracted all the other files in that directory, so I do not think there is anything wrong at my end. Has anyone had success with this file? Is it available at another FTP site? My copies came from atari.archive.umich.edu.

5245. Ghostscript 2.52 beta available.

Newsgroup: comp.sys.atari.st
Date: 1992-11-08 06:22:28 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <83213@ut-emx.uucp>
Source record: 215009

I know that this has taken a while, but I finally got a beta version of Ghostscript 2.52 ready. It can be obtained via anon ftp from lifshitz.ph.utexas.edu (pub/atari/ghostscript/beta/gs252b.zoo). Please do not upload this code to any other archives. When it seems that there are no major bugs, I will upload it to atari.archive.

I am particularly interested in whether the 8-bit color code in the screen driver works (in TT low-res I guess, or perhaps some graphics card). The driver does not yet set its own palette, but it searches the available palette for the nearest color, so the colors should be something close to correct (unlike previous versions). Of course, reports of any other bugs are welcome also.

For the majority of users, GS 2.52 is not significantly different from 2.41, except that a few command line options have been added (select paper size and band-printing buffer size) and the color screen driver is hopefully a bit better.

5246. File Attributes -- Is there one not being used?

Newsgroup: comp.sys.atari.st
Date: 1992-11-08 06:26:34 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.I1FyGfJQ0TA@elfhaven.ersys.edmonton.ab.ca>
Source record: 214912
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi!

I have come across an odd problem while trying to write a program.

What I need to do is use one of the "attribute" bits that are present in files
so that I can determine if my program has made use of a given file before.
This would function much like the "archive" bit, but would save quite a bit
of disk access time.

The problem is this; even though I payed Atari for the developer information,
they have not seen fit to update their GemDos manual since it was first
printed. Thus, I do not know which of the attribute bits are presently in
use and which are not.

Could someone who does please send me E-Mail, and I will summarize the
results here.

> Hard Drives, no one here can even get there Atari fixed, no Agent, NO PARTS.?

Roger,

The cdar504 was released for retail in New Zealand. I still have one
here we use from time to time.

Do you remember Jim Towler ? He was running one on "Tinkerbell" his BBS
there in Wellington some 5 years ago. We have been running one for asbout
(opps about) the same length of time as well.

I also have 4 Atari hard drives here are well Sh205,one ICD home brew,
and two mega files. My point the equipment WAS available here and still
is if you know where to look.

I was in Taupo the other day and at Whites Music Shop they have a STE
complete with Megafile 60 and all the software you could desire..

I agree there is now no support but hey Roger what has changed over the
last ten years ? I put it to you .. nothing!...

CoNnect does. It's emulation concering theese effects beats UniTerms
in some points. The only disadvantage is, that CoNnect cannot display
double width correctly - the characters are placed in the center of
two normal ones. Double size (i.e. double width AND height) are
displayed correctly.

5253. CoNnect 1.80

Newsgroup: comp.sys.atari.st
Date: 1992-11-09 00:42:46 UTC
From: f90-jos@byse.nada.kth.se
Message-ID: <1992Nov9.004246.11308@kth.se>
Source record: 215019

I tried CoNnect 1.80 yesterday, but I could not get it to send the letter }
(that is the swedish letter 'a' with a ring). The ordinary german letters
{, | and ~ (a, o and u with dots) worked fine, but not one of my favourite
letters: }.
I tried different terminal settings (I think I covered them all) but none of
them would send } correctly (or recieve it either).
Now I am using Uniterm, in which it is possible to select language and that
works without any problems.

Is there any way of sending and recieving the letter } correctly with CoNnect?

Greetings,

Johan

So, my big question is, is he going to add Tek graphics emulation. My main use of Uniterm is that it has Tek graphics, and without that, no program is useful

Do what I do - ignore Atari.archive, and connect to:

shavenyak.css.itd.umich.edu

WHich is a.a's host site - because the direct connect bypasses a.a completely, and goes straight to the source, it's also faster (But comparitively slower with more people, as a.a has 2-FTP 'lines'!

So there's still a few bbs's... that's good, we've still got
"The Trashcan" in ChCh, it has lots of new software that I FTP on it.

> I also have 4 Atari hard drives here are well Sh205,one ICD home brew,
>and two mega files. My point the equipment WAS available here and still
>is if you know where to look.

I agree with the WAS, but just where the hell can you buy anything
new now, and where can you get service in the country?
The only shops with anything have old stock that they've had for a while,
as for service... there is none... if your ST dies, you're in trouble.
Mine did 2 weeks ago, but luckily it was only the power supply, so I was
able to get a friend who services IBM's to fix it.
There's no dealer in the whole country, so how can retailers get parts to
service them????? Just where do we look Jon? The only place I can
think of is Mail order firms in US magazines... UK ones are too expensive
by the time you go through the exchange rate.

> I was in Taupo the other day and at Whites Music Shop they have a STE
>complete with Megafile 60 and all the software you could desire..

As I said, probably old stock.

> I agree there is now no support but hey Roger what has changed over the
>last ten years ? I put it to you .. nothing!...
>

Who needs support from Atari? I can get all I need from the other friendly
helpful users, something some of the other platforms can't boast about.
All I want is to be able to go down to a shop and get new toys to add
on to my computer, or be able to get the thing fixed if it dies.

Craig (Hoping atari gets a new dealer into the country soon!)

I think if you check hias message, what you'll actually find he said
was that 3u was a subset of the full VME 6u bus. It's a bus for 68000
type applicationa, and the standard for 3U doesn't support things like
bus mastering. This is a little different than the way you're telling
it.
The "maybe next time " comment was made regarding a full 6U
implementation. As to availability, you ignored my list of boards
specially made for the ST, and the hundreds of boards available in
Europe, assuming in your parochial way that US == WORLD. Sorry, that was
last year. Now you don't even own your own music industry.

Boy, this is really starting to get annoying. Please do not bypass the
atari.archive.umich.edu alias. This is perhaps the worst advice
I've seen all year. shavenyak is NOT the archive's host site.
It is merely a machine that allows ftp connections to the server
that houses the archive. It is not faster under normal circumstances.
The other host that handles the split ftp connections is actually a
much larger and faster machine. As a last but somewhat insignificant
note, there are far more than two ftp lines to the archive.

I would appreciate it in the future if all people not directly concerned
with the physical structure of the archive would stop making incorrect
inference about it. For every message you post here with incorrect
and/or stupid information, I get ~5-15 messages asking more questions
about that which you've posted (thus creating the vicious cycle that I've
grown overwhemingly irritated by).

If you have a question about the archive, I would be happy to answer
them via email. There is little need to post things here. I trust
that my email address is sufficiently well circulated by now.

Otherwise, if any of you that insist on continuing to post this rubbish,
please send me your snail mail address, so that I may send you
a quarter to purchase yourself a clue with.

John Henders writes:

>Bob, play fair. The 3u has many cards available for it, in highly
>specialised fields, like instrumentation, data aquisition, etc, etc.

Indeed.. I totally agree that *VME* is a standard world-wide..

HOWEVER.. the Atari implementation of that standard IS NOT
fully compatible with the industry acknowledged standard.

It's about as close to VME as "ASCI" was to the SCSI standard.

For anyone with the standard Atari short-memories, Allan Pratt
acknowledged that the Atari "VME" was not fully implemented,
saying something like "maybe next time".

There may be *hundreds* of 3U VME cards in the world.. how
many of those are of ANY interest to an Atari computer user?

(Actually, 3U is rarely used in the "real world".. the double
height 6U card is the most widely available.)

My message went on to ask if anyone out there has found any
3U cards that they've actually found useful..

In what way was my message "unfair"..?

I'd really like to know if anyone in the "real world" has
EVER found anything to plug into their (Atari)VME slot
that did anything useful for them..

(A bit of background.. I use, and know about those "VME"
cards for instrumentation and industrial control.. NONE of
the ones I'm familiar with would even FIT into an Atari
"VME" slot, much less be useful to the "average" Atari
owner).

This sounds a lot like the time I asked if ANYONE actually
had an "ATW"..

>Dec. And full production by Jan 93.

Hmmm... let's see..

The most believable reports are that there are about 50 "Atari dealers"
left in the United States...

So if the "official allocation" is 2 Falcons per dealer, that means
that the Atari production pipeline (whatever THAT means these days)
is 100 units TOTAL..

So.. how hard is it to build 100 computers..?

Must be pretty hard, I guess...

5267. Released: ASCREEN 3.2 (DVI previewer for Atari)

Newsgroup: comp.sys.atari.st
Date: 1992-11-09 10:19:58 UTC
From: lingnau@math.uni-frankfurt.de
Message-ID: <4045@rbiffm.informatik.uni-frankfurt.de>
Source record: 215037
Cross-posted to: comp.text.tex,comp.sys.atari.st

```
ANNOUNCEMENT --- ASCREEN 3.2
============================

I'm pleased to announce that the newest version of ASCREEN, the DVI
previewer for Atari computers, is now available for anonymous FTP.
Enhancements in this version include

- Fixes for various bugs in font handling, screen management and GEM
support. In particular, the bothersome bug concerning slashes in IMG
file names and the other bothersome bug concerning auto-repeat scroll
arrows have been removed.
- Facing pages can be shrunk and displayed together. A unique
`recto-verso mode' lets you page forward and back by two pages like in a
book.
- Extended keyboard commands for shrinking pages, setting the shrink factor,
and closing windows without having to use the mouse.
- Extended dialog boxes; many settings that required editing the setup file
can now be performed from within the program.
- Better handling of various error conditions.
- Support for CSG level 2 graphics and tpic \specials (mostly).
- German manual included (sorry folks, German only)
- Besides an example (in C) for `remote control' of ASCREEN, the
distribution contains `FontList', a program which lists the fonts
used in a document. The source code for this program is included, too.

You may get and use ASCREEN for free. You may also redistribute the
program, as long as you don't make any money off it or pretend that you
wrote it.

ASCREEN 3.2 is available for anonymous FTP from
ftp.math.uni-frankfurt.de [141.2.90.2], directory pub/atari:

ascr32.zoo - software, examples, Readme file etc.
ascr32dv.zoo - DVI file for (German) user manual
ascr32tx.zoo - TeX source code for the manual

(The manual is quite big, and I have separated it from the main
distribution so people who don't read German don't have to fetch it
anyhow. There is a short English introduction in ENGINTRO.TXT.) Some
other goodies, e. g., ready-made FLIB files with the most important
LaTeX fonts and AMSFonts, may be retrieved from there as well.

*Please note that this site is in Germany, Europe, and retrieve the
software only at off-peak times, that is, 1800-0800 hours CET
(UT+0100), or during the weekend.*
```

There is a mailing list for announcements, bug reports, comments,
questions and general discussion about ASCREEN; send mail to
`ascreen-request@math.uni-frankfurt.de' to subscribe or to find out
more.

5268. ST FORMAT DO IT AGAIN..

Newsgroup: comp.sys.atari.st
Date: 1992-11-09 10:33:28 UTC
From: sergio@dcs.warwick.ac.uk
Message-ID: <1992Nov9.103328.24501@dcs.warwick.ac.uk>
Source record: 215033

Hi ,I have just recently been to the Future Entertainment show {in England in London} where I bought a show programme, and in the part where the ST FORMAT {re Future Publishing} lot where talking about the new Falcon I happened upon some rather interesting specs..

qoute {as far as I can remember}
"...the standard Amiga and ST run at around0.25 MIPS whereas the new Falcon will be running at 30 to 35 MIPS..."

I thought these spec rather dubious (as they also said that the Falcon was a 16Mhz '030 ... *8-) {I understand that it also has a 16 bit address bus ?}
****
I repeat ,these are not my specs but ones I read in ST Format
show columns ****

please all flames by email to stformat only { if they have any such thing }
or by snail mail well thats all I had to say except that yet again ST Format confuse the public

```

Hi Folks,
A friend is moving his WP from 1st Word Plus on the ST to
Word Perfect a PC. Are there any utilities available to
convert 1st word files to a format suitable for reading
by WP without loosing all the formatting info. Dave.

5271. Atari User Group meeting - Wed Nov 11/92

Newsgroup: comp.sys.atari.st
Date: 1992-11-09 14:03:39 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <BxGCE4.JGn@math.uwaterloo.ca>
Source record: 214999
Cross-posted to: uw.sys.atari,kw.micro,comp.sys.atari.st,comp.sys.atari.8bit

In November, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a Library Night.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the November issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, November 11, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **
SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE ** SEQUENCER SALE **

Atari 520 ST System / CUBASE Ver. 2.01

Everything I have for the Atari is included. Some high points of the system
are as follows:

***** 1 Meg RAM
***** 3.5" Floppy Drive
***** 30 Meg HD
***** Atari SM-124 Hi-Res B/W Monitor
***** Clock/Calendar modification
***** All the normal stuff like cables, mouse, books.......
***** CUBASE Ver. 2.01 High end multi-track sequencing software
***** NEODESK Desk top interface
***** Various pieces of software including other sequencing/MIDI programs

********Everything works great on this system. I have a notice from
Steinberg offering an upgrade of CUBASE to the next revision.
That is also included with the system. I will not piece this
puppy out. One price takes it all! I would like to sell this
system to someone in the Bay area to avoid the hassle of
packing and shipping it. But if someone really wants it from
out of the area, and is willing to pay S&H, I will pack it
up for them and ship it out. I don't have any idea how much
it would cost to ship this baby.

PRICE: REDUCED REDUCED REDUCED
$550.00 or B/O

Reply to this account for further information. Or call me at:

(415) 367-3087 (before 3PM weekdays)

|> if you access the Mint partition from GEM, you'll corrupt it. Does
|> this mean that if I use a GEM backup program, I'll trash the Mint
|> partition? Should I tar it or use a .ttp backup program instead?
|>

Oh dear, does it really ? I'll have to make a few changes there.

What I was trying to say in my readme was to paraphrase the documentation that comes with minixfs. It is supposedly possible to trash the partition, but as it stands the distribution applies as many of the 'fool TOS into thinking nothing is here' bits of 'minit' as it can. I must say that I have accessed my drive under conditions where TOS "should" have corrupted data and nothing was lost. Still, I don't advise it. (So I'm paranoid... :-)

Also, (maybe I didn't make this clear), when MiNT/minixfs are running, you can run TOS programs to your hearts content. When minixfs isn't loaded, you should NOT be able to see anything on the partition. So if you can see the files, you should be able to use any method you wish to.

I use zoo to back up my partition (it compresses as well as backs up), then a GFA program to split it into 720k chunks. A decent 'cat' program (NOT the gnu utils one) will then put it all back together. This has the drawback that you have to have enough free space for the intermediate large .zoo file.

========

On a slightly different note, I've been away for a while, but now, hopefully, I can begin to bring the distribution set up to date (gcc 2.2.2 etc.). You might all have noted that on a minixfs system, the /tmp directory is not set +sticky either.

Simon.

5275. GCC AND THE ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-09 16:20:12 UTC
From: csi063@cch.coventry.ac.uk
Message-ID: <BxGIpq.50F@cck.coventry.ac.uk>
Source record: 215047

Help :

I have recently started a couple
of modules on my computer science
course on which we use the GCC/++
compiler. I was trying to locate
this compiler everywhere but to
no avail. I have located an old
version at uk.ac.lancs.pdsoft but
I was hoping to locate a newer
version.

If anyone knows of any FTP sites
that do or may hold an upto date
copy of GCC (v2.x or above) then
could they please contact me.

Sorry if the text is weird i'm
using a dec and the window is a
bit larger than the normal term
screen.. Hope it fits.

Thanks in advance :

Simon Love

: Is it true that C-Lab, the developer of Notator, has gone under?

No (or rather, it's the first time I've heard such a rumour and I know of no reason why there should be any truth behind it). C-Lab's distributors in this country recently mailed registered users about the new C-Lab sequencer, Notator Logic, the ST version of which should be due early next year.

>
>That seems to be the accepted procedure anyway..
>
>BobR

WHOA! Hold on there, Bob! I think you are being entirely unfair here. I was NOT making fun of Roger's dilemna in finding support for his Atari in New Zealand. Far from it... I well realize the difficulty and frustration in getting support from Atari or Atari dealers, rare commodities that they are. Having lived in Australia a few years, I can also sympathize with the specific problems of support that users face in Oz and NZ. It ain't easy in the US but it's even _worse_ there.

My complaint (OK, my bitch) to Roger was that he said "anyone considering an Atari computer needs to have their head examined." THAT is what I complained about... I don't like being insulted because I use an Atari computer. Do you?

Roger also owns a PC and has frequently touted it's virtues over the Atari in this newsgroup. Roger and I nitpick each other on occasion just to maintain a balanced perspective, but I still consider us "friends" on this net. WE don't have a problem with that, why do YOU?

>By the way, John.. I've seen your messages in the IBM games newsgroups..

Yes Bob, you are right. I have posted in the PC newsgroups. Is that a crime? Besides 3 Atari computers, I also own a PC and a Macintosh. Heck, I'd own an Amiga and a Silicon Graphics too if I could afford them. I enjoy each machine for different reasons although I admit, due to familiarity, I am more partial to the Atari machines. How does that make me one of the "bad guys???"

>Are we to take that as an indication of your dedication to the
>Atari Cheerleaders oath..?

My only Atari "oath" is towards my Atari customers, not the hardware itself.

>(Or should we just make fun of you because you couldn't just tough
>it out with the rest of the Atari regulars..?)

You are more than welcome to "make fun of me" as much as you like, Bob. It's a free country. But please do NOT insinuate (through ignorance or otherwise) that I have abandoned the Atari camp and my Atari customers solely because I use and enjoy other machines too. I may be a computer geek, but I'm not traitorous!

I need to upgrade to 3.7x myself. According to posts on GEnie
you need to send your original disk and $25 to :

CodeHead Technologies
P.O. Box 74090
Los Angeles, Ca. 90004

Tel (213) 386-5735
Fax (213) 386-5789

If you recently (the last month or so) they may be willing to
wave the $25, 3.7x has been out for about a month now. It never
hurts to ask, but be ready to show your receipt.

Gee, I don't know Roger. I haven't seen NVDI advertised in the US, although I'm sure there must be someone who carries it. Most US users have gone to CodeHead's WARP 9 for their screen acceleration needs.

I'd like to see a good, honest comparison of the two, however.

True, the ST Deluxe Paint shouldn't be mistaken for the Amiga/PC version, but
it's still a great package. I was a dyed-in-the-wool NeoChrome fan (and not
even the final release -- the one they sent with my computer way back when)
until I tried Da Vinci/Deluxe Paint ST.

Just remember that MIPS stands for "Meaningless Indicator of Processor Speed" (and various similar things :-). Although the DSP is rated somewhere above 20 MIPS by itself, maybe this is what ST Format was thinking of when they said that. Who knows, maybe they thought with the DSP at 25 MIPS, say, and the 68030 CPU at, say, 5 MIPS, you could get 30 MIPS... Kind of a hokey comparison if you ask me. :) Anyway, it should be pretty fast, and _really_ fast in running programs which can utilize the DSP intensively.

>
>
>I thought these spec rather dubious (as they also said that the Falcon was
>a 16Mhz '030 ... *8-) {I understand that it also has a 16 bit address bus ?}

Why do people keep saying it has a 16-bit address/data bus? Atari's own oficial brochure says "32-bit data bus, 32-bit address bus." This seems clear enough to me, and I really doubt that Atari could get away with printing lies in their brochures. That's against the law in the U.S.A., besides it wouldn't do a heck of a lot for the loyalty of the customers either.

You can send e-mail to the CodeHeads at the following addresses:

John Eidsvoog - eidsvoog@delphi.com
Charles F. Johnson - cfj@delphi.com

Charles is currently on tour with Hiroshima, and probably won't be logging in
from the road, but John does log in periodically.

Remember that CodeHead Technologies has limited hours. (10 a.m. to 1 p.m. PST)
The update is $15 and your original disk. And, it's a nice upgrade, too.

I had similar problems with a Quantum LPS52. I called Supra Technical
Support ((503)967-2440) and they told me the old Supra host adaptor
would not work with this drive because the drive is "too fast" for it.
The newer Supra adaptor would supposedly work, though.

I haven't heard of Notator Logic but I did get a postcard announcing that C-LAB has re-grouped and formed a new compnay called EMAGIC. I also stated that ENSONIQ will be the US distributor. The products which they mentioned as being part of the new company were: Notator SL, Creator SL, Unitor 2, Export and Notator Alpha. According to the card, questions can be directed to ENSONIQ customer service at (215)-647-3930.

Hey, I know you really want this stuff, so look at what I've got :

Atari520STFm.....base system, 1-2yrs old low useage, no problems
bunches of shareware/commercial software (100+ discs)
paid $375....asking $225

VIDI ST 16 color greyscale video digitiser...full colour with
VIDIChrome, 50 frames per secon ! paid $175....asking $80

GTS 100 external 3.5" drive. very quiet NEC mechanism. mech replaced
by NEC ~1 year ago. has a digital LED track readout
paid $175....asking $85

please respond via this net to ensure hasty communication

5296. What about Flash II?

Newsgroup: comp.sys.atari.st
Date: 1992-11-10 01:35:08 UTC
From: ntomczak@vega.math.ualberta.ca
Message-ID: <ntomczak.721359308@vega>
Source record: 214911
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My friend, for some reasons not entirely clear to me, loves Flash.
Currently he is searching for a reasonable terminal program which
would run smoothly on his TT. He dials quite often to places like
Compu$erve and Genie. File transfer protocols used there are
hence a must. He was thinking about upgrading to Flash II but
he would like to here from users of this terminal program if
this is a reasonable thing to do. He tried Connect and FZDT
and so far he is not impressed. He knows about Storm but tells me
that an upgrade price makes Flash II more atractive. Besides he
is alergic to Basic.

If you have some stories indicating that Flash II is good
(remember - mono TT) or bad for his purposes please e-mail them
to me or post.

When will Atari ever get it right? It happend with the Mega, Mega STe and now the Falcon. Will they ever put the user first and deliver the goods on time? I first got my hands on a pre-production Falcon in July and was like every one else, impressed. Admitidly, the Falcon was a friend's, but I could not wait to buy my own. Release sometime early October, October arrives, no Falcon! Now I learn that Atari are planning to release a limited number of 4MB, HD-Falcons in the first week of December, but no 1MB, no HD-Falcon!!
Come on Atari! How can you possibly miss the Christmas market?? The basic Falcon is the only one that most users can afford, and will be the best seller. I for one can't afford nearly 900 pounds! Commodore panicked when they heard about the Falcon, and have managed to produce the goods with the 1200, a good computer, but not a scratch on the Falcon. Basicly Atari and Commodore produce good computers, but Atari has crap organisation and their marketing stinks. I am one P****D Atari user.

I know I am not alone, Atari should also know the extent of their madness.

5309. late Falcons...

Newsgroup: comp.sys.atari.st
Date: 1992-11-10 13:26:40 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Nov10.132640.14986@crc.ac.uk>
Source record: 214923

Everyone knows that the Falcons are late...
I agree that Atari should have tried to get the christmas market, *BUT*,

Do you remember that Atari said the Falcons would be redesigned early next year (with a TT style, ie a seperate box+keyboard)?

Maybe Atari are giving the few(?) ST style Falcons they have to developers so that there will be lots of software, and also to a few dealers to show people what the machine can do.

They have said that full scale production will start early next year, so hopefully this will be with the new design, the idea being that everyone will have the same type of machine making upgrades etc easier because they can all be the same.
IF this is the case, I think it will be worth the wait, but it's a pity they will miss the christmas sales. (maybe next christmas!)

BTW I have tried to get a SM146 mono monitor from Evesham Micros (the only semi-Atari dealer here in Cambridge (UK) but they said that Atari hasn't shipped any yet.
Is this true or is it that only this shop hasn't got any?
(what's the difference between SM124,125,144,146 etc?)

Only my opinions,
Phil (Desperate to get a Falcon :-))
(E-mail naffara@uk.ac.crc)

--
Kryten (When Cat says why don't we raise the defensive shields?) "A superlative suggestion sir,with only two drawbacks: one,we don't have any defensive shields and two,we don't have any defensive shields.I know that,technically,that's only one drawback,but it was such a big one I thought I'd mention it twice".

As far as I know, C-Lab is still alive.

The last version should be 3.1 or 3.2 (or something like that).

Since C-Lab is a German company your local distributor might
be the problem.

About going into PD: Why should any program worth DM 1000.-
(or $600 ;-)) be dumped into PD? Would you?

A friend yesturday said he'd seen the FALCON in Dusseldoff and the screen scrolling in 'true colour' mode was like glue. I haven't actually seen a falcon yet but I have read most articles on it and this wasn't mentioned. Since he owns a TT and is likely to be biased, can anyone else set my mind at rest ???

Thanks - Chris (cdw@dcs.ed.ac.uk)

5314. Re: SPX's

Newsgroup: comp.sys.atari.st
Date: 1992-11-10 15:50:10 UTC
From: EENG6826@RyeVm.Ryerson.Ca
Message-ID: <92315.105011EENG6826@RyeVm.Ryerson.Ca>
Source record: 214877

I uploaded 2 SPX pictures to a.a on the file SPX01.LZH. Maybe they have disappeared ?!? Also I have 12 disks full of them.
To create an SPX:

-- Get a large GIF that has a 320x??? size.
-- Use an IBM program to clip the different parts
-- Use SPX Creator v1.4 to put all parts together {I don't have this!)
-- {You can also write your own program, the parts are just ICE Packed and then concatonated together)

What is the best GIF viewer available for the Atari? I
have an Atari 520stfm which has had a 1meg memory upgrade.
The only gifviewer I have is gifshow, and it does not seem
to be able to handle gif's over 100000bytes in size.
Please respond by mail or post.

As far as I know it's on atari.archive. I tried it and wasn't very impressed.
A simple 'hello world' program took ages to compile and link, and ended up at
~30k using 'write' for printing; ~6k using GEMDOS level commands.

If someone's no longer using their copy of Lemmings for the Atari ST, I'd be interested in buying it. I've seen it new for $20 from Bare Bones Software. I'm willing to pay $12 (U.S. funds) for it used, assuming you pay shipping and include the original disk, manual, and preferably the box, too.

Or if anyone's seen it for less than $20 from a mail order place, could you let me know?

Please reply by e-mail.

Thanks.

Let me try to be a bit more helpful - but alas only a bit. If you have
a recent update of WordPerfect for the ST (this leaves out 99% of ST
users, I know) you can, if I remember correctly, convert a Wordplus file
to Wperf format. It wasn't brilliant when I last tried it (2 years
ago), but it was marginally better than ASCII transfer.

Once you have the Wperf/ST file, you need to save it in Wperf 4.2 format
on a PC-readable floppy, then your PC version of Wperf should be able to
read the file.

Overall, the ASCII route might be easiest.

Graham

From: geoffc@zebedee.uucp
Message-ID: <H.1sxuvuTFqgw@zebedee.uucp>
Source record: 214859

I've just finished upgrading from Mercury 1.18 to Hermes 1.03 and appart from a few problems with understanding the German, it was a largely painless transition. I wouldn't reccomend it to anyone who hasn't used Mercury before as the docs are patchy to say the least !

A few questions though:

1. Is there a better news reader than GUS ? I don't like the GEM interface as it slows me down. Although I can use rn (from the Mercury package) OK it would be really nice to get a better news reader (eg: can do Kill of a subject, etc). I've heard that NN is good - any comments ?

2. How can you get the expire program to work ? The format of the expire.def file is a mystery to me as my German isn't all that good and there isn't an example in the package.

3. Is there anyway I can get gus to remember what my username is - I've got a current.usr file setup but I still have to type geoffc every time. I've tried setting up a LOGNAME environment variable but it doesn't seem to make any difference.

4. How do I setup a signature file ?

Cheers

Geoffrey

PS: Thanks to Craig Shore (from New Zealand) for sending me the Hermes disk !

Hi folks,

After finally upgrading my ST to 2.5 MB I decided it was time to
start a serious attempt to install MiNT. I used ZOO.TTP, version
2.1 (92/07/09), with the command e// mint095b.zoo *.* to extract
the stuff from the archive. However, after zoo had finished, not
all files were extracted, e.g. the faq and the copyrigh.t files
were missing. Any ideas what went wrong?
I should say that I'm not too well informed about packers, and
that I use lharc for my own archiving purposes. So maybe I did
not use the correct zoo command?

Thanx in advance for any hints,

Greetinx, Jan

I'm not surprised. Scrolling on my TT in TT med res (16 colors) is noticably
slower than scrolling in ST high res (2 colors), for example.

>Must be pretty hard, I guess...
>
>BobR

Oh, come on Bob. According to a reader verified survey in AtariUser magazine earlier this year, there are over 200 Atari dealers in the US. Add to that the number of Canadian dealers (I'd guess about 50, considering there are about 6 or 7 in Vancouver alone), and you've got about 500 machines for dealers in North America alone. I presume there are at least that many dealers in Europe and Australia & New Zealand combined, so you're looking at over 1000 machines for dealer demo units.

Albeit this still isn't a lot of machines, but it's much more than 100.

(In case you doubt the survey, these are dealers that actually answered the phone and had machines for sale on the premises. Also, this does not include mail-order houses)

Hey, at least Atari has been sending them to developers!

At least when Atari starts selling them in quantities early next year,
there will be plenty of software to take advantage of it.

I wonder what Atari has planned for COMDEX... They better not release the
Falcon040 and then not deliver until December 1993!

In a previous article, kgrubb@cee.hw.ac.uk (Kevin J Grubb) says:

>When will Atari ever get it right? It happend with the Mega, Mega STe and now the Falcon.
>Will they ever put the user first and deliver the goods on time? I first got my hands on
>a pre-production Falcon in July and was like every one else, impressed. Admitidly, the
>Falcon was a friend's, but I could not wait to buy my own. Release sometime early October,
>October arrives, no Falcon! Now I learn that Atari are planning to release a limited
>number of 4MB, HD-Falcons in the first week of December, but no 1MB, no HD-Falcon!!

Yes, you have that right. Atari needs to start getting themselves together.

I was hoping that Atari would have at least 10,000 units out there SOMEWHERE.

Of course, there would be no way that Atari would be able to capitalize on
this Christmas market.

>Come on Atari! How can you possibly miss the Christmas market?? The basic Falcon is the
>only one that most users can afford, and will be the best seller. I for one can't afford
>nearly 900 pounds! Commodore panicked when they heard about the Falcon, and have managed
>to produce the goods with the 1200, a good computer, but not a scratch on the Falcon.

And your right again, rumors about the Falcon030 have been around since late
Spring of '92.

These rumors have given COMMODORE plenty of time to get something ready
for the Falcon030 when it is finally released...

I'll bet by the time the Falcon030 is released, we see an Amiga 800 or
something that will compete directly with it.

>Basicly Atari and Commodore produce good computers, but Atari has crap organisation and
>their marketing stinks. I am one P****D Atari user.
>
>I know I am not alone, Atari should also know the extent of their madness.
>

But you heard Greg Pratt at the November, 1991 Atari Show.

He said that Atari will no doubt release a new computer next year, but
no one should count on getting one until January 1993.

I have a lot of respect for Greg Pratt and when he left, I became VERY worried
about the company.

>Everyone knows that the Falcons are late...
>I agree that Atari should have tried to get the christmas market, *BUT*,
>
>Do you remember that Atari said the Falcons would be redesigned early next year
>(with a TT style, ie a seperate box+keyboard)?

No, I don't remember that.

All I remember is Sam Tramiel saying, "No comment" to all questions about
future machines.

I bet we see a 33 MHz 68030 based PC-style case at the Fall COMDEX.

And a 40 MHz 68040 PC/tower case within 6 months.

There is no doubt in my mind that the Falcon030 will be sold in its
1040STe case. Atari needs a "home computer" to sell at WaldenSoftware and
Electronic Boutique.

>
>Maybe Atari are giving the few(?) ST style Falcons they have to developers so
>that there will be lots of software, and also to a few dealers to show people
>what the machine can do.

I agree that they are giving developers TIME to develop (in which I'm hoping
they are doing), but I think we will see the same Falcon030 on shelves in
two-three months.

Maybe Atari is attempting to get rid of all of the older 1040 STe and
Mega STe units before shipping the Falcon030??

Or maybe they are getting all of their factories ready for the entire
Falcon series of computers.

Hahaha! I'm sure the people at Motorola would be curious to hear
how you cranked 30-35 MIPS out of a 16mhz 68030. That is faster
than a Sparcstation (all but the most expensive ones, that is)!
I would be very surprised if it even approached 10 MIPS.

Listen prople, why buy a computer which has no real software. Why don't we all just take a pill and cool off. Even if Atari made the Christmas deadline, the lack of software (software meaningful for the Falcon) would create a problem. You can't expect developers to come up with quality software in less that six months, not even Microsoft can produce that fast.

You people who are whining that Atari missed the Christmas rush, would be the first people to cry about the lack of software for the FALCON.

Sigh, just caaaaalm down....

When I use the popup dialer (right mouse click) and select a number for Uniterm to dial, it dials ok, but how do I get it to STOP ?

If the line is busy it just keeps going forever !!!

I've pressed every #$@!#%^$#^$ key on the keyboard, and pressed both mouse buttons !

I'm using version 2.0e

Mike

The very best one, IMHO, is Gemview by D.Fiebelkorn. It is full GEM, works as .PRG and .ACC and displays virtually all picture formats including .JPG (at least the newer versions do). It should be available at a.a. and on most German ftp-sites carrying ATARI stuff.

>higher resolution!)
It is manufactured by
OverScan Gbr
Saentisstrasse 166
D-1000 Berlin 48
Germany
(I hope this address is still correct).

Last time I remember it was about 100DM, but at the atari-fair in
Duesseldorf it was sold cheaper (~60-80 DM ?)

However, this great piece of hardware can only be installed in
260ST/520ST/1040ST/MegaST machines, *not* in STE or TT types !

cu

From: grillo@flash.ATC.Olivetti.Com
Message-ID: <56880@olivea.atc.olivetti.com>
Source record: 215051

Hi there,

I'm looking for a ST program called SEQUENCER ONE a sequencer that can
handle both midi and sampled sound. It was on the Cover Disk of ST FORMAT 30
magazine, but that number went SOLD OUT 2 months ago.
If this program works on High rez (b/w) monitor coull anyone send it to me ?
We can eventually swap some others "legal" things.

Thank you.
Savino

I'm afraid to report, that this new ascreen doesn't run under MiNT. I
checked it yesterday evening and couldn't get it run with MiNT (0.96)
installed. Once I removed MiNT from the auto folder and rebooted with
plain TOS (2.06 on a 68030) it ran just fine.

From what I've seen the program is well worth some additinal effort to
get it run under MiNT.

Hey, think about the state Atari is in right now - restructuring etc. Users have also expressed their feelings about another machine in the ST/STe casing. I think it might be wise for Atari to wait until January to introduce the Falcon and then in a new casing. There is no software available right now which takes specific advantage of the machine and would it really be such a Christmas hit?? Maybe it is better for Atari to get their cash from LYNX sales this Christmas so that they can back a real Falcon campaign early next year???

Just thoughts...

This fix was posted a long time ago (aug 1988) by Werner W. Braun. I don't
think he would mind my reposting it as he wrote "I hope this will help
someone else"...

I have personally applied this fix to two SM124 monitors and it cured the
problem completely. Both monitors still work fine, many years later.

Peter Knoppers - knop@duteca.et.tudelft.nl

------message <8808101333.AA23692@ucbvax.berkeley.edu> follows------
Some days ago i sent a plea for help to all Atarians in netland:

> Is someone out there in netland who knows a difference between older and the
> newest SM124 B&W-monitors which could explain the following behavier:
> Mega ST4 and old (Oct. 87) Monitor:
> In reverse mode (light text on black background) is brightness dependent
> on information on screen !
> Mega ST4 and new (Mar. 88) Monitor:
> The symptom does not occur !

Our dealer didn't know of this problem, he told me all SM124 monitors are
returned to Atari for repair because they get no parts from Atari. So they
have no experience with these monitors. (Thanks to V.A.Brandt who gave me
an important hint)

I decided to take an oscilloscope and did some measurements.
As far as i know at two places the brightness of a CRT is controlled:

1) the first gate (hope this is the right technical term)
2) the cathode voltage/current.

The voltage between cathode and 1st gate should be constant, by adjusting this
you can control brightness of the monitor.

Therefore i measured the voltage of the first gate against ground: it was
constant, so this was apparently not the cause of the trouble.
Then i measured the cathode voltage, which should be +70V as the schematics say.
I found these voltage to be screen-image dependant:

with a light screen i found +70V,
with completely dark screen i found +85V.
The cathode current varied between 0mA (no bright, no contrast) and 17mA (full bright and full contrast). So i think the problem is a bad regulation of cathode voltage. If the load is too small (dark screen or only some light characters on a dark screen, the cathode current is small) cathode voltage goes up and voltage difference between cathode and 2nd gate goes down ---> screen fades.

And now my fix:
Beware --- I'm a simple minded chemist who ownes a soldering iron but is not an EE, so i will take no warranty for any side effects of my fix. It works with our monitor, but i fixed it today and so have no experience on the long run. It's a simple fix and should do no harm to your SM124. What do i do?
I put a little extra load (1.5mA) at the high voltage transformer, so that the current never sinks under 1.5mA and cathode voltage never goes up again. With maximum brightness and contrast i measured 17mA, in normal operating condition about 8-13mA, so this extra current should never overload the transformer. But i give no warranty for this! Be carefull if you turn on full brightness and full contrast.

The procedure is given for a monitor manufactured in oct '87, the newer ones have a different PCB layout.

1. Open the monitor by removing the 5 screws.

2. Look at the small board which is plugged on the end of the CRT. There you find the names of the parts printed. Look for C308 (47uF/100V) at the lower right edge of the board. If the board is covered with a shielding, you may have a newer monitor and this fix possibly does not apply.

3. Get a resistor 47k ohms 0.25 W and solder it across the pins of C308.
Put the resistor at the right boarder of the board so that it does not touch the monitor box later.
Pay attention to the small space between the monitor box and the board.
Possible Damage of your monitor!

4. Close the monitor, cross fingers and switch on. Problem should have gone.

PP: I also found some differences between the circuit drawings and the actual board, but this should be no problem. But i supplied R302 with 1k/0.25W, but this is not necessary for the fix

part was should be

R302 open 1k
R311 68R 47R
R312 270R 240R
R313 820R 680R

I hope this will help someone else, forgive the rather long posting.

Source record: 215059

Reprinted From Z*NET 92-17:

C-LAB FOLDS, EMAGIC TAKES OVER
Internal company unrest and division has brought C-Lab, developers and manufacturers of the most successful Atari MIDI sequencing programs, Creator and Notator, to an end. C-Lab products will be taken over by a new company formed by Ensoniq, the US distributors of C-Lab as well as a line of electronic hardware for the music industry. EMAGIC will maintain support and development of the Atari platform, and includes some of the same people who were C-Lab. Notator 3.1 was recently hailed in Keyboard magazine as the best MIDI sequencing program available for any computer. Announcements from Ensoniq about Emagic include news of "Notator Logic" for the Macintosh, to be released before the end of 1992. Emagic joins Steinberg/Jones and Barefoot Software as the major remaining MIDI developers for Atari computers. Barefoot formed from the Hybrid Arts takeover this summer, and Dr. T's stopped developing for the Atari in 1992. Contact Emagic through Ensoniq Corp, attention David Netting, 155 Great Valley Parkway, Malvern, CT 19355, 213-647-3930, extension 297.

>Is there anyone who has experience with the RS232 und GFA or some tips,
>routines, sources?

First, sorry for the delay in replying, I don't know if anyone has already responded, but here goes:

My first tip would be to avoid INPAUX$. I know it's a nice command (I used to use it a lot too), but it seems to screw up CTS/RTS flow control completely, and I've no doubt it does the same for XON/XOFF too. I assume it works by pulling bytes directly from the RS232 buffer, and then adjusting the pointers, which must confuse the OS in some way - at least, it does with my extended buffers, anyway.

Stick to multiple INP?(1) and INP(1) commands, or their GEMDOS equivalents. If that still doesn't work, try sending Control-S directly from your program and see if that stops the data stream correctly.

If all else fails, simply extend the buffer size to give you more time to read the data. Mind you, this is only a solution for bursts of data; if the scope keeps sending data all the time, you'll only be postponing the inevitable.

To enlarge the RS232 buffer, first use iorec(0) [XBIOS(14,0)] which returns the address of the current serial I/O table. This is a structure with the following contents:

LONG Pointer to the current RS232 buffer in memory
WORD Current size of the buffer (in bytes)
WORD Head index (in bytes) i.e. pointer to next unread byte of data
WORD Tail index (in bytes) i.e. pointer to last byte of data waiting
WORD Low watermark (in bytes)
WORD High watermark (in bytes)

This table is followed in memory by another, identical, one for outgoing data, but that doesn't usually need to be changed.

The High and Low watermarks are used for flow control - when there are more unread bytes in the buffer than allowed for by the High value, a 'stop flow' command is issued. The start flow will only be issued when the buffer has been emptied down to the Low level. A good rule of thumb for these would be around 75% to 90% of the buffer size for the High value, and around 50% to 75% for the low value, depending on how quickly your device responds to XOFF.

To change the buffer size, first store the existing values so you can reset them later, then MALLOC a nice big buffer and store its address into the first LONG. Don't go beyond about 32k. Next store the buffer size into the next WORD, and set up the High and Low watermark values accordiningly. Finally, zero the Head and Tail indexes. It's best to do all this while there's no data coming in from the RS232 port, otherwise you'll lose some of it.

I hope at least some of the above was helpful.

Hi Atari folks,

a friend of mine is looking for good statistics packages for his
ST computer. Since the main use will be standard deviations and
such, extreme sophistication is not necessary. However, the
package should be easy to use and have possibilities for
producing graphical output, or at least an interface to a
standard tool for this purpose, e.g. to spreadsheets.
Of course, PD software is preferred, but pointers to commercial
packages are also welcome.

Thanx in advance

5352. 96002's got a silcon bug!

Newsgroup: comp.sys.atari.st
Date: 1992-11-11 12:34:47 UTC
From: richard@star.ic.ac.uk
Message-ID: <1992Nov11.123447.6345@sol.ctr.columbia.edu>
Source record: 215062

Believe me or not, but I work in the same group as a guy whose
working with a 96002. It's been confirmed by Motorola US that
he's discovered a bug on the chip. Apparently when you do a
parallel load at the same time as doing a dma access (and probably
a few other conditions as well ... I could find out exact details)
then a bit of some data gets cleared.
He's working on real time image processing, and trying to push the chip
as fast as possible.

Now, there was a discussion going on about 'wouldn't it be nice to have
a 96002 in a falcon 040', yes but it would have been damn expensive, but
now that it's got an obscure bug wouldn't it be possible for atari to buy
up old stock and make the dream a reality. OK so it would have a small bug
on it, but couldn't you program around that? Obviously they'd have to
make clear that it's not a fully functional 96002, but it's still damn fast.

Does any one know what normally happens to chips with a bug on them, are theu
sold? Or just binned - motorolas reputation etc.

Richard

DISCLAIMER: I'm not gong to be held responsible for any of the above, I'm
not a rumour monger, but if motorola are wrong and the chip is OK,
then maybe I'm misinformed. Just remember where you heard it first...

:

Forget it!

Installing it on a harddisk MIGHT be possible if you do some VERY serious hacking (involving writing your own harddiskdriver and modifying the program to use this one and simply copy complete disk images onto harddisk)

F1GP does work on a 520 (I think) and will have to run from a VERY low memory location, screwing up everything (including 99% of all harddiskdrivers) and since it doesn't use gemdos() file access you'll have to rewrite the "file" routines anyway so it involves a LOT of work even for the MOST talented hackers. My advice is: Write a letter to the publisher and tell him why you won't be buying any more of their games.. Might work! :)

Btw, an alternative is to get Vroom which isn't on that many disks :)

Cheers,

- Torbjorn

Yeah I've had an order with them for about 4 weeks now, and they still
claim they have no idea when the SM146 will actually reach them !

>Is this true or is it that only this shop hasn't got any?

Yes I would like to know too, I have lots of work lined up that really
needs a decent monitor, and if someone actually has them in stock I'd
be very willing to transfer my order!!!!

>(what's the difference between SM124,125,144,146 etc?)

Well from what I've managed to find out (thanks to all those that sent me
the information), 24&25 are the old 12inch monitors, I've used them before
and they're pritty good, the 144 is the later 14 (more like 13) inch monitor
with horizontal & vertical controls to allow you to fill the entire screen
area(no border), it has all controls at the frount. And the 146 is basicly
like the 144 but has been improved to get rid of some display flicker problem
that the 144 had, the horiz & vert controls are missing, but the factory
settings fill most of the screen area anyway.

All of them have mono sound and the 144&146 have tilt&swivel bases (excellent!)
:-)

Hope that helps.

>If this program works on High rez (b/w) monitor coull anyone send it to me ?
>We can eventually swap some others "legal" things.
>
>Thank you.
> Savino

I don't think this would be "legal" if you were sent a copy (disk or e-mail) rather than the original disk: commercial software like Sequencer One is typically licensed to ST Format etc. to be sold ONLY as a cover disk: it isn't made PD. Note that several companies are still advertising Sequencer One for sale at commercial rates (say 40 pounds).
No I'm not a lawyer - just worried about comp.sys.atari.st being used (however innocently) to encourage (probably unintentional) piracy.

I would try OPUS. A shareware package with graphic part.
Available for german users per ftp in Stuttgart (rusmv1/129.69.1.12)
After some troubles with GDOS it works very fine.

>buttons !

>I'm using version 2.0e

This is a bug that appeared in all 2.0e versions prior to (I believe)
015. What you need to do is put a 1 in the redial section of the dialer menu
as a blank or a 0 will cause the symptoms you describe.

Or use the newer (>=015) version...I don't know where you can get it
though. (If I remember the new version fixed a bug (a feature IMHO) having
to do with the mouse edit...its been so long since I've used Uniterm that I've
forgotten tho. I think it had to do with not inserting cariage returns. :)

The reason that CoNnect is visably slower is that it _doesn't_ use
custom fonts, or rather it lets you use lots of standard GDOS fonts, because it
uses GDOS (and the standard VDI that goes with it). This is why a screen
accelerator (like Warp9 or NVDI) will help speed up screen speed _immeasurably_
- well, ok, maybe you can measure it, but whatever the difference is, it is
a very significant, VERY NOTICABLE difference.

If I remember correctly, it might help to use it in monochrome too.

>--
>Piet van Oostrum <piet@cs.ruu.nl>

The statement about Dr.T's having stopped development for the Atari in
1992 is false. Dr.T's is online on GEnie and they report KCS Omega V5.0
is currently under development and will be released in early 1993. It
will run on a Falcon030, although it will not take advantage of many of
the new sound capabilities of the new machine (yes, Dr.T's has a
Falcon).

While the Atari version of X-oR is currently on the back burner, some
work on an upgrade has been done (though it would be wise not to hold
your breath for it to be released). X-oR profiles are currently being
written for several new instruments (my source for this info cannot be
disputed! ;^) and will be released by Dr.T's early next year.

Granted, the focus of Dr.T's development has moved towards the PC, but
it has not stopped on the ST!

5362. ICD HARD DISK UTILS

Newsgroup: comp.sys.atari.st
Date: 1992-11-11 15:57:09 UTC
From: csi063@cch.coventry.ac.uk
Message-ID: <BxK6zA.H73@cck.coventry.ac.uk>
Source record: 215075

HELP WANTED YET AGAIN :-

I have a Seagate Hard disk running under the ICD 4.8x utility suite
but have managed to get a corupted ICDBOOT.PRG on my boot disk.

I have just re-partitioned the drive and now have no way of booting
it any more.

Has anyone out there got the ICD suite or know where I would be able
to get a copy (FTP SITES).

Urgent replies wanted as am getting desperate !

Many Thanks,

Simon Love (csi063@uk.ac.cov.cck)

>I just tried to ftp something from the umich ftp archive. It would let
>me browse the directories, but when I tried to get something it said
>there was something wrong with the directory structure..

This is an example of a highly detailed trouble-call. NOT!

If you're going to post such 'requests for information', please be a bit more specific with the details. As an example:

"I just tried to FTP something from the atari.archive site. I could browse the New directory, but when I tried to get something from that directory it gave the following error:

'You are not authorized to get files from this directory'

How come?"

To which, of course, Jeff Weiner (and I, as surrogate in this particular USENET newsgroup posting) would reply:

"Send me an e-mail message rather than attempting to get answers from a large group of people who

(a) don't have the slightest idea what you are talking about;

(b) don't have the access to answer your question if they DO know what you are talking about;

(c) don't have the means to correct a problem in the first place."

Of course, there could be something wrong with the directory structure, but without quoting the actual error message you received, and without information about the file you were attempting to retreive and what directory you were attempting to retrieve it from, your posting isn't going to get you the answers you want.

>Regarding 80 columns in a window with STORM...

>STORM already uses a custom font that allows full width lines in
>a GEM window...

How is the speed? I use an ST (8 MHz) at work as a terminal attached to a 19.2K serial line, and while Uniterm is fast enough on its own, if I add Codekeys it slows down too much too work satisfactorily. ConNect was visibly lower, perhaps due to its custom fonts.

5365. Problems at atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1992-11-11 18:00:11 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1drhnbINN63g@terminator.rs.itd.umich.edu>
Source record: 215074
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Here's a list of known problems that I (we) are working on to
remedy:

1. There's no files in Applications/Perutls, Applications/Math,
Applications/Wordproc or Applications/Spreadsheets. That was a
result of having to ftp everything over. I just forgot about 'em.

2. There's very few editors in Editors. Similar problem to
the above.

3. On occasion, you'll get server not responding errors. This is
because there was an air conditioner problem in the machine room. I
think this is all better now.

4. Bart doesn't work. We're still looking for a host machine for
it to run on.

5. I've been particularly angry at people posting questions about
the archive to comp.sys.atari.st. This is because the problem
reports should be going to me, not the world, who can't do much
about it.

6. On occasion, particular volumes in the archive won't be working.
I don't know why this happens, other than the fact that each
root level directory is mounted on a separate disk. It is
possible that each of the disks could go down for backup individually
from time to time. (Along with other possibilities I haven't even
dreamed of yet).

In short, this is a new experience for me too. I'd appreciate people
letting me know, by mail, of any and all problems that they
have. I'll try to remedy them as best as my schedule and
physical location (I'm 700 miles away from umich now) will permit.

After following the combat in rec.music.synth et al.... I've come to realize that we rarely provide ata-persons here....

I just wanted to thank Jeff for running Atari Archive. Problems happen (see, can say it without offending anyone:-). For a free service, I think it is great. I'm glad there are people willing to stick their nose in and do something when it is needed.

So, I hope everyone will try to have a positive tone as Jeff works through the changes at Atari Archive (remember when it appeared that AA would disappear early in the year....) and remember that he is performing a service to our community.

Thanks Jeff! Have fun! - Bob

According to ICD you may download there software from either
CompuServe, GEnie, or their own BBS. They do not allow other
BBS's to post copies of their software.

I've recently seen some UK people accessing CompuServe, so I think
that will be your best bet.

Your only other choice will be to send your ORIGINAL disk to ICD
and get updates. Their phone number in the US is (815) 968-2228.

ST-Format had a deal on NVDI a while back, (August Issue I think).
They seemed to reckon it was a pretty good little package, I'll fish around
and if I can find the details for you!

ST-Format may deal out a lot of garbage info', but some of these soft-
ware deals are quite good!

>and is likely to be biased, can anyone else set my mind at rest ???
>

Well _I_ haven't seen a Falcon either, but here are some points that may be
relevant :
1) You would expect the window scrolling to be slower in true-color or
256 color mode, as the computer has to churn through lots more
screen memory. This is true on any platform, although until
recently Atari screen modes have all used the same amount of
memory, making comparisons between modes pretty similar. Remember
that a bitmapped 768x480x65536 (true color overscan) will gobble up
720KB of memory.
2) For the normal desktop, you wouldn't really want to run true color,
you'd use 16 color (which would be equivalent to TT medium,
640x480x16, with a larger palette) or 256 color at most.
applications which require true color, like raytracing, slideshows,
video digitizers, etc. will be able to change the resolution and
use the VDI, even if you are not in that resolution.
3) Someone a few weeks ago reported that they saw a demo Falcon
running in 256 color mode, and that it seemed about as fast as
the TT in 16 color mode. This kind of speed is very good for
256 colors (if you've never seen a TT in medium res, with Warp 9,
it's very fast), especially when you compare it to, say, MS
Windows. :-) I've seen Windows in 256 color mode and it
crawls terribly. For a PC you need to buy an expensive
graphics accelerator or get a completely different bus
architecture = $$$$.

Don't mean to degrade this into a PC vs Atari war, but Ataris have always
been fast at video applications, and I don't think the Falcon is any
exception. :-)

If you are not eager to do kernel developing, probably you want to know
about MiNT, which is much more pleasant to use on the ST.
>
>How UNIX is it? If selling, HOW MUCH? What is the recommended sys config for
>running it? What can you do with it (multiuser? modem?)? Those are a few of
>the questions that spring to mind.
Minix is not much Unix, as it does not swap. Any process is memory
resident. The 68000 processor is not very usable to program a real Unix
or equivalent, as processes have to be in the same memory location for
the duration of their execution.
This limitation can remedied by having lots of memory. I would recommend
twice as much as all processes you want to run together. As Minix is
developed for the 8088 you may count 128kB for each process.

For Multi-User application you should be warned that there is no
protection against destructive actions buy other users on the ST. The
protection is a bit better on the 8088.
Also Minix is limited to the level of 'version 7', which is not what
most unix users want.

For basic stats, I use Kuma's KSpread 3, which is not bad (despite appearing quite primitive at first view). It is also said to interface to K-Spread, though I don't have personal experience of this.

For nice graphs, Scigraph is hard to beat, although data entry is a little irritating.

Both programs run perfectly on a TT, in ST Hi or TT Med.

5386. Reason for Falcon delay

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 08:50:33 UTC
From: anderss@colargol
Message-ID: <1992Nov12.085033.18063@ugle.unit.no>
Source record: 215094

The reason for the delay of the Falcon is that Atari has
pulled it back and redesigned the graphics system. This was done
when they got the specifications for the A1200. The Falcon has now
been improved with higher graphic resolutions, the max. resolution
is now 1280*960. (I don't know how many colors there will be in this
resolution). This is done to ensure that the Falcon is better than
the A1200 in all ways!!!
The minimum RAM config. will now be 4MB, and the new Falcon will
cost the same as the 1MB Falcon was supposed to ship for.
Machines should be shipping by the end of next week. (Unless Atari
decide something else...)

5389. Multisync/VGA monitors

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 10:12:39 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1992Nov12.101239@cs.bham.ac.uk>
Source record: 215100

Hi!
I've been wondering for a while about getting a multisync for
my MegaSTE so I can show low/med/hi res on one screen, and also possibly
get a VME display board at some point.

This month, ST Format has printed the connections to fix an ST to a
VGA multisync monitor - is that a good idea, will it work or is it
worth it me getting a multisync instead? Someday I might get a Falcon
(perhaps the 040 - I don't mind waiting!), so can anyone see any
problems connecting one to a multisync such as the NEC/3D?

Can anyone recommend a VME graphics card for the Mega/STE?

Thanks!!!

5390. MGIF 4.0 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 11:18:35 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <BxLoqz.KD0@news.chalmers.se>
Source record: 214857

The binaries and sources for the new and MUCH faster version of MGIF have now
been uploaded to atari.archive.

This version is based on the released sources for version 3.5. It does not
include all the enhancements of version 3.7 which was only available in binary
form. It does however allocate memory dynamically.

You may have seen that the files are already in the Graphics directory at
atari.archive but, please, do not download the files dated November 11th.
I made a small change to the program last night that cut the load time for non
interlaced GIFs by a further 30%. This new version was uploaded today
(November 12th) and will soon replace the old one.

The files you want are called:
mgif40b.zoo - binaries
mgif40s.zoo - sources for GCC 2.1, Lattice C 5.52 and Turbo C 2.0
(they will probably work with other versions too)

--
If you plan to compile the sources with Turbo C you have to disable nested
comments. I forgot to mention this in the readme file in the source archive.
--

All comments, suggestions for improvements and bug reports are welcome.

Scrolling should not be a problem. Falcon030 has hardware scrolling! That is
useless with desktop windows though BUT true colour mode is not supported in
desktop so the problem is just that the programmer did not make use of it!
Nobody used it on STe so that is nothing new. So it is definitely software
that made it slow.

> Does anybody know of an accurate speed test which works across a variety of
>machines?

Now _there's_ a can of worms! Devising an accurate indication of performance that works across a variety of machines is extremely hard. It's the goal of "the general benchmark", and it may be an unattainable goal.

Dhrystone is not a good general benchmark for a number of reasons:

1) It contains few loops. Studies have shown that most programs contain a high percentage of loops, and that code inside loops is significantly different to that found outside.
2) Large parts of the V1 benchmark can be optimised away by "dead code" removal.
3) Dhrystone was originally written in Ada, then converted to C. The conversion is not faithful to the Ada original, particularly when it comes to string operations
4) The poor analysis of operators lead to the inclusion of a number of string operations. These string operations introduce a significant amount of computation and looping into a program that contains few loops. Hence, Dhrystone results depend very much on the efficiency of the string operations in your prticular library.

If you want to read a discussion of why general benchmarking is hard, and a critique of various benchmarks, you could check out the following (sorry, couldn't resist):

MJ Lodge, "Benchmarking and Ada", 3rd year MEng Project Report, University of York, UK.

About the best benchmarks around are the SPEC suite, a set of application based benchmarks. Most "high end" manufacturers (Atari isn't one of them) are members of SPEC, and the benchmarks tend to be written in C for Unix machines.

In summary: determining "general" performance is hard, and error prone. If you do need to measure performance, then base it on the relative performance of a given application that is relevant to your area of interest.

It is slow because Atari STILL haven't made use of STe's hardware scrolling
(which I assume is available on the Falcon) in TOS. Apart from the slowdown
due to loss of available memory bandwidth, scrolling should not be any slower
in the Falcon's high resolution modes.
The funny thing is that Atari recently complained about games programmers
not using the facilities of the STe.

5394. Idea for a program

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 12:17:07 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Nov12.071708.20452@newstand.syr.edu>
Source record: 214868

Here's an idea for all you programmers out there...what about a program that will allow one to control another computer, remotely via a modem? I do not know if it is possible, or if it has alredy been done, but it would be nice to have...I think. There are programs like this on other platforms...Carbon Copy (msdos) and Carbon Copy for the Mac, PC Remote, PC Anywhere, and even remote access for the Mac using system 7.

I imagine it would be easiest to come up with something that lets one control another ST remotely...but it would be even neater to be able to control an msdos machine, or even a Mac remotely.

BSTAT, available on the atari.archive (or was before the move, anyway) is large, comprehensive, and good for graphics. I haven't actually tested its statistical features, of which there are many, since my own interest was in using it to graph (and print) data arrays. It is shareware.

I would.

>we all just take a pill and cool off. Even if Atari made the Christmas
>deadline, the lack of software (software meaningful for the Falcon)

1) Most of the old software should still work (although 3x faster)
2) If the A1200 gets out first it will have a considerable advantage over the Falcon, however inferior it is (remember Betamax v VHS?).
3) Software will only be written in quantity once the machine has been officially released (people have been caught out once before with that games console that Atari sent to developers last year, only to withdraw it later, then there was the Abaq which was 6 months from being released at one stage, not to mention the CD-ROM that was fully reviewed in PCW at one stage).
4) There would be software written for it after I had one for a week :-)

>would create a problem. You can't expect developers to come up with
>quality software in less that six months, not even Microsoft can produce

First they try to keep the bug very quiet, threatening to sue anybody who claims its existance, while at the same time quietly fixing the bug. Then they admit it about a year later offering free replacements (which now only cost 5 pence to make), throw all the old ones away and claim loads of credit for being so generous.

Probably.

Some observations from this months (Dec) UK mags:

Silica shop are advertising the Faclon (they are one of the main distributers)

Hisoft are releasing their truepaint this month (Nov)...

so perhaps Atari were not joking after all, maybe November is the month
we can start buying Faclons in the UK?

I decided to upgrade to Flash II for a small price from my old Flash (1.5?) and wasn't much impressed at first. Well, I just got my free (except postage) to ver. 2.01. Some annoying bugs are gone and it is much faster. Version 2.0 didn't show much of a speed increase considering that I went from 2400 to 9600 baud. Now, whole pages are basically flashed on the screen at 9600 and above. So, the only reason for me to use Uniterm now is that the kermit setup and download procedure is more convenient in Uniterm - not a big deal though. By the way, I'm very pleased with promptness and service in general with the company in Palatine, Ill. They are very interested with any bugs that anyone finds. These bugs appear to be corrected with each new upgrade.

CUL,
Chuck

Just curious, since it was mentioned that the Falcon seemed slow in
True Color mode - I wonder if Warp 9 works with the Falcon as is, or
if maybe a revision would work for Falcon-specific screens as well.
I mean, my MegaSTe screen is a tad slow until I kick in Warp 9, then it
speeds along nicely (especially with a disk cache)...

It is a well-known problem in a certain production batch of SM124s. The fix has been posted here a number of times. It should be in the FAQ!

If you can't find the fix (it involves soldering in a capacitor so you need some experience or have someone do it for you) I'll dig it up (might take a while though :-)

>When I use the popup dialer (right mouse click) and select a number for
>Uniterm to dial, it dials ok, but how do I get it to STOP ?

To cancel dialing (such as in the case that the line is busy), my version of Uniterm simply requires a Control-C to put you back into normal mode.

You are now in contact with your modem. My modem stops trying to connect and hangs up if you type any key before carriers connect.

So it ends up being Control-C then any other key. Hope this works in your version.

Source record: 214869

Gerald Greenberg writes:
>Here's an idea for all you programmers out there...what about
>a program that will allow one to control another computer,
>remotely via a modem?

I have a variation on this idea that I believe is fantastic and achievable:

We have terminals. They were designed to read and write text characters that would control the host. You can edit text, run programs, transfer files, and so on.

Terminals got better. They did fancy escape sequences so that you could clear portions of the screen, use scrolling on portions of the screen, and even process special characters, some of which were "line-drawing" characters to make boxes and lines. This is like the VT52, VT100, etc.

Terminals got even better. They began to use graphics escape sequences to draw lines from any point to any other point, mix it with text, scale and rotate the text, etc, as early as the VT125, and Tektronix.

Now we are at a day when many personal computers can emulate terminals, and we have workstations networked together instead of a central computer with dumb terminals. Furthermore, we have X-windows and such where you can open up any number of windows on a workstation where each window represents a terminal, a game board, a picture, a notebook, a drawing tablet, or basically anything you want.

Because X-windows is free from M.I.T., and because it is so successful, and because it is so flexible, and popular, I suggest that we implement X-windows for the ST (and other computers as well).

X-windows function calls are standard, and there would be compatibility between any system (you could paint a picture with the same commands on an ST as well as a PC as well as a DECstations 3100). Because it can be implemented via modem (I know, modems are quite slow when it comes to drawing graphics remotely), you could call up a host, and it would run it's chess program on your screen: you enter the keystrokes or mouse clicks, and it draws on your screen the results.

If you could define a chess "font", where the letter "A" is really a pawn, where the letter "B" is really a knight, etc., then the host running your chess game need only send 64 characters to completely describe the board. In this case, fantastic graphics via modem is achievable.

>resolution). This is done to ensure that the Falcon is better than
>the A1200 in all ways!!!

If this was TRUE, it would be fantastic, but call me an unbeliever. I don't think that Atari could redesign the graphics chip that quick.

The only thing that I can think of is that the same graphics chip designed for the Falcon040 will be used in the Falcon030.

But, I'd like a few more people to confirm this story.

It would EXPLAIN the delay though.

> The minimum RAM config. will now be 4MB, and the new Falcon will
>cost the same as the 1MB Falcon was supposed to ship for.
> Machines should be shipping by the end of next week. (Unless Atari
>decide something else...)

Again, call me an unbeliever. I remember developers crying about the lack of a 1280*960 resolution and the 1 Meg of memory in which they claimed the Falcon030 needed AT LEAST 2 megs, but really 4 Megs to make great software for it.

It would be completely unlike Atari's management to listen to developers.

Also, how can Atari ADD 3 Megs to the system without passing along the cost to you and I? I would think Atari would at least add another $100 to the price.

5410. atari.archive news

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 20:22:49 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1992Nov12.202249.18537@news2.cis.umn.edu>
Source record: 214874

This is just a short message to let you all know that the majority of files which were in the New directory have been moved to their respective directories (and the Newitems directory has been updated). I would like to take this time to request that whenever you upload a file into the New directory, you also upload a text file describing the upload and giving an e-mail address where you can be reached. As an example:

NOWWHAT.ARC
---
davidli@simvax.labmed.umn.edu

This archive contains the complete set of OSS Personal Pascal programming articles written by David Meile in 1986.

I would like to ask for reuploads of the following files:

pt13demo.lzh
unarj_st.lzh

Both of these files had CRC errors, and thus did not get placed in the atari.archive directories.

Also, would the person(s) who uploaded the following please send me an e-mail message telling me about the files?

ovfix1.prg
ldrdemo.tos
dfslide.msa

Without any documentation, .PRG and .TOS files are next to impossible to place correctly, and checking them out is also an impossible task.

Anyway, with the huge backlog of files out of the way, new upload turnaround should be fairly quick. Keep those files coming folks!

-- David Paschall-Zimbel

BTW: If you notice that a file in the comprehensive index (0compind.Z) is missing and you happen to have that file archived handily and can upload it, please do -- and let us know about it!

5411. My MiNT distribution kit

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 20:30:04 UTC

Message-ID: <1992Nov12.203004@phwoof.ph.kcl.ac.uk>
Source record: 214866

I've noticed that atari.archive has a directory /atari/Mint/Distrib_kit (or something similar). Could everybody *NOT* use the kit that (presumably) will be placed in there. It is currently in /atari/New/{boot,disk1-5}.zoo.

I'm working on a GEM-based installation kit which will make it to the ftp area on dogmatix.ph.kcl.ac.uk in the next few days (read: by the weekend). It is *MUCH* more flexible, and ought to be easier to use. It'll also be *much* easier to keep up to date, since programs are grouped together as subsets (eg: the gcc subset contains all the gcc-related binaries, and the gccinc subset contains the gcc include files). The limiting factor is the number of programs I have on HD that need to be categorised and set together, and their presence noted in the config file.

Jeff - I know you don't like being talked to via the usenet group, but could you please NOT put those zoo files in the Distrib_kit directory. If you want to mirror me here, they will be placed in ~ftp/pub/MiNT. Thanks.

While I'm on the subject, if you upload anything for MiNT to a.a.u.e, (or anywhere else for that matter), could you email me here at kcl (either sjg@dogmatix.ph.kcl.ac.uk or sjg@phwoof.ph.kcl.ac.uk)

There have been a couple of things I'd like to hear more of... someone said they were doing an equivalent of the Sun /dev/audio. That would be nice. Someone has just beat me to it to do a build of 'sh' from the bsd sources. I'm looking into doing a version of the socket library instead. (Useful if we ever get X running on an ST...:-)

Simon.

From Z*Net 92-17 w/o permission:

C-LAB FOLDS, EMAGIC TAKES OVER
Internal company unrest and division has brought C-Lab, developers and manufacturers of the most successful Atari MIDI sequencing programs, Creator and Notator, to an end. C-Lab products will be taken over by a new company formed by Ensoniq, the US distributors of C-Lab as well as a line of electronic hardware for the music industry. EMAGIC will maintain support and development of the Atari platform, and includes some of the same people who were C-Lab. Notator 3.1 was recently hailed in Keyboard magazine as the best MIDI sequencing program available for any computer. Announcements from Ensoniq about Emagic include news of "Notator Logic" for the Macintosh, to be released before the end of 1992. Emagic joins Steinberg/Jones and Barefoot Software as the major remaining MIDI developers for Atari computers. Barefoot formed from the Hybrid Arts takeover this summer, and Dr. T's stopped developing for the Atari in 1992. Contact Emagic through Ensoniq Corp, attention David Netting, 155 Great Valley Parkway, Malvern, CT 19355, 213-647-3930, extension 297.

5415. X windows server on ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-12 22:30:26 UTC
From: wmagro@uiuc.edu
Message-ID: <BxMJuv.n4n@news.cso.uiuc.edu>
Source record: 214875

There has been a lot of talk about making an X windows server for the ST. I have zero GEM programming experience, but I do have the gcc cross compiler on my SPARC at work. I downloaded the server part of the MIT X11R5 distribution, just to see how a server is put together. I figured the atari server wouldn't be that much different from a MacII server (at least for monochrome displays).

Conveniently, the mit distribution separates device independent code from device dependent code. The MacII screen code was done by apple, and they based their code on the sun code. Before I even start trying to compile the device independent code (and then making a screen driver for the ST), I need to know about which unix calls have counterparts in MiNT/MultiTOS. Where is there a comprehensive list? (I suppose I could look at the mint.h header file.)

Finally, is someone else (presumably smarter than me) already attempting this port? If so, I will sit and wait. Otherwise, has someone already attempted it and failed, and is there an obvious reason why I, too, will fail? Help me out. I think we'd all like to see a server.

>E-Mail: jan@janhh.hanse.de

Yes. Eiffel is available for the ST. in the U.S, it is iavailable from

Interactive Software Engineering Inc.
270 Storke Road
Goleta, CA
93117
USA
T: (805)685-1006
F: (805)685-6869

I got some info sent to me a while back and it seems as the atari version is
not a true compiler but instead converts Eiffel code to C which can then be
compiled. Price for Eiffel/S is US$185.

NN is very good, as long as you don't care about having absolutely
no access to GEM. There is an Anglish help file around to help you set
it up. If you actually pay to register Hermes, you'll get source to Gus.
et all, and can fix it any way you like.

>2. How can you get the expire program to work ? The format of the

From: jeffy@syrinx.umd.edu
Message-ID: <16955@umd5.umd.edu>
Source record: 214882

Thanks to all the folks who responded to my query about using a Quantum LPS105 on my ST. I've currently got it working using ICD's The Link adaptor and it's been running fine for about 5 days. As the drive was free to me, it wasn't such a bad thing to have to get a new host adaptor.

As far as I know, Spectre works perfectly well with most bigscreens.
With SM194 and TTM194 Spectre works for sure, Dave Small has himself
tested this, if I remember it correctly.
I have seen and used Spectre with a Mega4 equipped with the Viking
Moniterm graphic card and SM194. Impressive!

As I recall, according to Spectre 3.0 docs this does work: 1280x960 resolution.

DTP packages should be able to help you with this one - though you MAY need
to use an intermediate file format, probably not though.

Does GEMVIEW have file format conversion yet? Seems a shame, since it
already has all the read routines (yes, I know reading a file format
is easier than writing it).

5424. Midi Networking

Newsgroup: comp.sys.atari.st
Date: 1992-11-13 06:38:59 UTC
From: "J.J. Lehett" <JJL101@psuvm.psu.edu>
Message-ID: <92318.013859JJL101@psuvm.psu.edu>
Source record: 214889

Situation:
MegaSTe - Tos 2.06 - Maxtor 120 meg HD
1040 STfm - Tos 1.02 (I think, I know not .04)

I want to see what a midi network will do for the 1040, even if slow
transfer times.
mx2net: did run ok, but on partitions larger than 16 megs, the 1040 choked
it seems... havent a a pre-tos 2.0 machine in a while, but I rememeber this as
a problem. Is there a way around this? Is this also a problem then for the
1040 when accessing the maxtor remotely?
anet: this loads fine on the machines, but with the minimal docs with it,
I am not sure if something is set up wrong, but I cannot get any remote access
at all, is anyone familiar with this program?
mikenet: this looks to be the newest of the shareware lot, but the .arj file
at umich has 3 files, but the docs hint of more. It runs fine on the mega
but gives 3 bombs on the 1040... any ideas at all on this one?

So... any help appreciated, especially those who are currently running a
midi network with one of the above, or some other one not mentioned. I am also
going to be looking into the commercial offerings, but wanted to sample the
shareware route first.

Thanks in advance!

Sorry, some problems with the newsprogram so I'm not able
to do a followup/reply to the original thread.

Ok, this is how I got the information. It was given by one of Ataris
offices in Europe as a reason for the Falcons delay. I will not tell
which office, as isn't relevant and might cause some problems for
the person who said this. (It sure isn't Atari in Norway, as they have
closed down their office this summer).
Sure, I'm not 100% certain that this information is correct, but it's
the only reason for the Falcons delay I've got from Atari.

Bill Sheppard asked about the speed in Storm...

I haven't tried a direct line at 19.2Kb, but I use it at 19.2
on my 9600 baud modem with no problems...

Then again, I don't have anything like CodeKeys running either,
but it seems to be pretty capable.

I don't exactly like the custom font all that much, and it's
one of the things Alan Page is considering changing, but at least
it's not like the bloopy letters in the old 8-bit HomeTerm..!

>bus mastering. This is a little different than the way you're telling
>it.

>The "maybe next time " comment was made regarding a full 6U
>implementation.

Sorry John.. wrong twice in one message.

VME is by definition a master/slave architecture. The physical
size of the board has NOTHING to do with the electrical
characteristics of the bus.

The standard 3U card is fully implemented. The 6U card, in
addition to the extra area available for component layout, only
adds extra, optional, address and data lines.

And, Allen Pratt's comment WAS addressing the shortcomings of
the non-standard Atari implementation of the VME bus, saying
that "maybe next time" they'd do a full, STANDARD,
implementation of the VME standard.

I'm afraid I missed your list of hundreds of 3U VME cards for
the ST... or did you mean there are hundreds of VME cards that
FIT into the ST..? How many of those hundreds of cards have
you seen running in an ST..?

Again, the AVME slot on the MegaSTe and TT are usable by only
a tiny fraction of the available VME cards, and by only a
tiny fraction of Atari owners. If anything, Atari was using
the buzzword "VME" to try to sell computers to people who had
no idea what it meant...

5434. Falcon Lands in Australia.

Newsgroup: comp.sys.atari.st
Date: 1992-11-13 10:24:01 UTC
From: danieldr@ecr.mu.oz.au
Message-ID: <9231821.23667@mulga.cs.mu.OZ.AU>
Source record: 214894

The Falcon 030 was seen for the first time in Australia at the home
computer show in Melbourne. Coincidentally, next door (in the same building)
to where I am doing exams at the moment.
They had two Falcons on display, one in a darker than
usual atari ST case, the other in a lighter shade. Both seemed to be still
very early development machines. They had some nice hi-res colour pics...
which they unrolled and faded in different ways. The machine was equipped
with a 65 mB internal drive and 4 meg ram.
Unfortunately, no multi TOS was present on the falcons displayed
After questioning the rep, (who seemed to know what he was talking
about with regards to the specs etc....ie he didn't talk vapour), said that
multi-tos was nearly ready and would be shipped with the initial release of
the machine.
Tos 4.0, with its colour icons, was the system it was using. What
I forgot to tell the rep was whether this desktop, was the NEWDESK, or
just the TT's desktop. I get the feeling it was the TT's desktop, as the
icons didn't have sound assocaited with them, and the overall desktop stilll
had a very GEM'ish look and feel to it. (thoough visibly quicker in window
updates).
They didn't really have any decent software to show. Probably the
most impressive thing, was a little public domain program (no flashy colours
on screen, just GEM text and icon boxes, afraid to say) which did real time
sound manipulation.....I particuliar like the Wemberly stadium effect....
When you spoke into the microphone, you would get back instantaneusly your
voice as if in the stadium......great stuff.....boy could I have some fun with that. The
rep, confirmed that a virtual modem could be possible, but wasn't sure
whether TELECOMM would approve such a device....
As for the price.....well I was told under $2000 (AUS) for the 4mb,
65 Mb HD version.....pretty impressive.
Overall, I thought the machine really just wasn't displayed as well as
it should have. If I it was up to me to display....I'd look at doing a hyped
up karaoke......with full on video clip graphics etc....You need that type
of thing to attract the morons.....Oh well, you have to realize that they
were struggling for availability of software.
Release date.....January-February ....

I think I'll buy one.....great for a sampler alongside my synthesiser.

Daniel.

Could someone from ATARI s staff please respond to all the questions about the delay of the FALCONS!!!

I know the chance of anything like that to happen is as big as if I got rich over night, but please give us SOME info. It does not take 4 months to produce 3-4000 machines unless something is redesigned or the company lack money. I just hope the latter is not the problem.

Anyway get the Falcon for sale soon or just forget it. The same senario happend to the TT and it took over a year from it s first public demonstration to it was available in the shops. Lets just hope and pray this is not the fact with the FALCON030.

Rune H.

5436. THE STORM

Newsgroup: comp.sys.atari.st

Well I thought that you chaps would like to read a few notes that I have got
back from Alan Page on GEnie, the Flash 1.6 man and also the author
of the NEW STORM....

To: R.SHEPPARD5 Roger Sheppard

Sub: Flash and STORM

Reply: Item #1347885 from R.SHEPPARD5 on 92/11/08 at 02:34

Sorry, no wildcard (don't care) characters. However Storm has a lot of
features to handle automating logons. You can wait for multiple strings
simultaneously. The PROMPT$(n) functions returns a string containing
up to 'n' characters in front of the current cursor location. SCREEN$(n)
returns an entire line of text from the terminal screen. 'n' chooses
which line to return. Trailing spaces are stripped out, so a blank line
returns an empty string.
The terminal is designed to NEVER miss a character while you are waiting
for a string. Flash could sometimes miss a character, especially at
high speeds. Flash II has a poorly designed WAIT command. Try waiting
for "ALALAN" in Flash II. It can't find it! It gets confused by strings
that have the beginning of the string repeated.
I used a text editor to count the occurences of the word "THE" in a
large text file. I then sent it computer-to-computer at 9600 baud and
used Storm to wait for and count "THE"'s. It did the job correctly and
did not noticably slow down terminal operation. That's because the
WAIT function is table-driven and has critical portions coded in
assembly code.
Storm is loaded with string functions, including UCASE$, LCASE$, LTRIM$,
RTRIM$, INSTR, MID$ statement and function, LEFT$, RIGHT$, and several
more. Using SCREEN$ to read text of the terminal screen means it will be
able to do things like select items off screen menus for you, even when
the menus change. e.g. search news items for all menu items containing
a particular topic.
- Alan

Reply: Item #1412769 from R.SHEPPARD5 on 92/11/09 at 05:18

I am just finishing up VT100/VT102 terminal emulation, including character sets with graphics, bold, underline, blink, etc. 132 column will probably require scrolling around the window, unless you have a large screen monitor. Terminal emulations are loadable/unloadable modules, which makes releasing updates easier. Also, I plan to release source code for the VT100/VT102 module, so that people can customize it. I do not have specs on the VT2XX/VT3XX stuff, though it is quite possible that some talented person out there could update my code to add the necessary support.
File transfers are also loadable/unloadable. At the moment they include CompuServe BPlus, XYmodem and Zmodem. I have not decided whether or not to release that source code. The file transfers work in the background, allowing you to do other stuff while a file transfer is in progress, though at 19200 baud, there may not be a lot of CPU time left over.

That's true, but you should also mention what the hardware scrolling is, to stop other people from spreading such $%^$!@#$%$ shit. IMHO the so called hardware scrolling is just the ability to scroll the screen LEFT or RIGHT in steps of one pixel, which was completely impossible on the "normal" ST (unless you'd like to write a program and bit-shift it on your own). The UP / DOWN scrolling (ok, ok there's only upscrolling in GEMDOS output) can only be done by some kinda program (or the blitter perhaps), but in every case a tremendous amount of memory has got to be shiftet. Just a little math: (taken from a PC clone) When you're running 1024 * 768 pixels in 256 colours you've got to shift 768K of memory to scroll up one single line (text or graphic). I once saw this on an 33MHz 386 and it was pretty slow. As far as I'm informed the Falcon will not be able to display this resolution, so the memory which needs to be shifted will be smaller, but in every case its the multiple amount of the 32k on a "normal" ST, so I may very well believe that it may appear "slow". But I think that mocking around this or other speed stuff is useless until ever somebody has actually seen a Falcon (except developers). And I also think that people should better sit down and think twice before spreading such rumours. People always say their computer's too slow and they want to buy a new, a faster one, but who really NEEDS this speed? (in general, not only ST, but PC clones also).

TeSche

P.S.:Please don't write a followup if your computer can display 769 lines, which would be one more, so 100/768 percent more and thus better and calling up hundreds of other flames...

I have Silent Service 1. Is Silent Service 2 an
improvement worth the $45 it costs?

5440. WARP 9 and CAD 3D 2.0

Newsgroup: comp.sys.atari.st
Date: 1992-11-13 14:10:15 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <1992Nov13.141015.3457@porthos.cc.bellcore.com>
Source record: 214806

Earlier I had lamented the fact that Quick ST 3, and later WARP 9,
did not work with CAD 3D. A version 3.6 patch sent to me by the
Codeheads fixes the problem.

One problem left: has anyone successfully gotten the CAD 3D hardcopy
routine to work with G+plus replacing GDOS?

Is Tom Hudson still writing software somewhere? This CYBER series
is just incredible.

Source record: 214809

i am new to the ST world with a used 520-STfm. i cannot seem to get
a display on the t.v. port. is there some info that is not in the
standard doc?

i am running a 75ohm cable, rca to video, straight to the 75 ohm input
to the t.v.

do i have to somehow select the low res mode? i get sound, the GEM
"chime", but the video looks like a field of hash marks.

also, i have monochrome moniter and it works fine. however, some software
either does'nt load completely or doesn't show anything on the display, like
'leader board' and 'music studio88', and i wonder if these _require_ a color
moniter or if i should at least see something on the mono or the t.v. port.

thank you,

loren

Source record: 214815

I'm having trouble running a programme in a TOSwin window, namely elvis.
I managed to convince elvis that it was in a vt52 window, but it's not
actually running IN the window. It's running like a regular TOS programme,
obliterating the desktop.

I've tried running elvis from the TOSwin startup menu, and from an existing
window, with no success.

Somebody help me! Thanks in advance.

>Sorry John.. wrong twice in one message.

Well, you got me there, Bob. I guess I should know better than to
beleive anything without checking other sources than what Atari says. I
thought the 3u card was a subset of the 6u, which had a much more
limited set of capabilitities, as it was designed for 68000 machines,
thus the 16/24 format, and lack of bus mastering, due to the 68000's
lack of built ability to be interupted cleanly.
As for the list, as I didn't post it, you didn't miss it. I was
going by someones post here when the machine came out that said the 3u
format was quitye common in Europe. I guess I missed the part where they
said none of them would work on the Mega STe bus.
Oh well, I don't care as much that Atari doesn't use an industry
standard bus, but it's to bad they can't settle on a standard for
themselves.

Tom Hudson was writing software for Autodesk; I'm pretty sure he worked on Studio 3D. You can see some of the similarities between it and the Cyber stuff. It even supports the Cyber format.

If you're looking for more 3D stuff for the ST, I'd highly recommend that you contact Lexicor Software. Their stuff is much easier to use than the Cyber series, while still remaining compatible for the most part.

Well, if my sources can be trusted, the real story goes something like this
: There _are_ falcons around - the STe cased ones, and they've been around
for well over a month now - the problem is that _not_one_ dealer anywhere in
the world (in some countries the decision was made by atari themselves)
wants to sell them in this case - so, what we are doing now is waiting for
the tooling involved in putting the falcon in a three-box style case. Go
thank your dealers and so forth - the facon was a going concern a long time
ago.

Well, Blox and HacMan II, which you can FTP from atari.archive, both
work on all Atari machines (including the Falcon). Blox supports DMA
sound, but only if your register. These games even let you return to
your work after playing without leaving your desktop totally trashed.
(What a concept!)

Both of these games are by the editors of ST Format. Oh, WAIT A
SECOND, they're actually by me. Sorry. Shouldn't let myself get
so absorbed in these Atari magazines. :-|

> This is not to say they should make games you _can't_ run off of
>floppy, but don't prevent us from using our Hard drives if we've got 'em.

Games that don't run from hard drive are EVIL!

All opinions are IMHO. (Well, you asked...)

5456. Re: MGIF 4.0 uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 14:59:52 UTC
From: garth@splunge.uucp
Message-ID: <1992Nov15.145952.20444@splunge.uucp>
Source record: 214824

Just a quick request: could anybody who has access to the newest version of MGIF (4.0) and who has a GEnie account (North America) *please* upload the binaries to GEnie so that those of us who don't have ftp capabilities can still get at the binaries? If someone out there in net-land knows that this has already been done, please ignore this request. Thanks for your patience, everybody.

Garth Wood

5457. Freeze Dried Ripoff!

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 15:46:02 UTC
From: as423@cleveland.Freenet.Edu
Message-ID: <1e5rbqINN179@usenet.INS.CWRU.Edu>
Source record: 214821

Has anyone else out there been ripped off by Aaron Hopkins
and his Freeze Dried Term? I have been waiting six months for
his product, the check was cashed in early July. I have sent him
a letter with a photocopy of the check explaining I have not yet
received the program, and would he please send it. I figure the
only way I will get my money is if I take a little 2 1/2 hour
drive to Manhattan Beach and knock on his door. It is too bad,
one jerk can make is bad on all shareware authors. Once again,
do not buy his product unless you wish to lose $25.00. And it's
name would be better as Freeze Dried Ripoff Ware!

5458. For Sale 80MB portable hard drive system

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 16:32:07 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <Nov15.163207.25504@yuma.ACNS.ColoState.EDU>
Source record: 214822

For Sale: 80MB (Quantum Pro 80S) portable hard drive system

It's housed in a 5"x3"x12" metal shoebox with power supply and fan, the box has
a handle on the back for carrying around. ICD host adaptor with clock build-in.
The drive is a Quantum PRO80S 3.5" drive same as used in some Mac. Drive is
about 2years old with light use (it's backup system in case my main drive went
bad or when changing the main system set-up).
ICD software (boot v5.x) included, DMA cable also included.
Asking : $275
If interested, please reply thru Email to sytang@lamar.colostate.edu
Reason to sell: Upgrading the system and no longer need this system.

Thank you.
Tang
sytang@lamar.colostate.edu

5459. The prgflags.ttp is not up at A.A.

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 17:13:08 UTC
From: baffoni@aludra.usc.edu
Message-ID: <1e60f4INNdb4@aludra.usc.edu>
Source record: 214823

Hi All,

I was looking for the prgflags.ttp program that lets you change the
bits that determine which memory programs run out of (TT or ST ram on a TT)
but I can't find it up on A.A.U.E. Does anyone have it and could either
uuencode/send it to me, or post it up on A.A.?

Or is it up on A.A. in a place besides atari/Utilities and atari/Tt?
I did look/grep through the 0index and ls-lR.Z, but no prog.

-MikeB

5460. APL

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 17:57:15 UTC
From: as_radfo@csd.uwe.ac.uk
Message-ID: <1992Nov15.175715.10063@csd.uwe.ac.uk>
Source record: 214825

APL is now available for the AtariST at a very reasonable cost.

It's called I-APL, and costs 11 UK pounds (disk + manual) from:

56 The Crescent
Milton
Weston-super-Mare, Avon
England BS22 8DU

I guess there's a need to add a little for overseas postage/packing.

Queries: I-APL, 11 Auburn Road, Redland, Bristol BS6 6LS, England.

I bought it recently and am very pleased with it.

Alas, no credit card sales.

I have no connection (despite my address!) with this organisation.

5461. CHAOS a.archive demo disk problem!

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 18:35:50 UTC
From: markjl@buengf.bu.edu
Message-ID: <102003@bu.edu>
Source record: 214826

Hello fellow Atarians,
[haha, gotta love those greetings!]
I recently downloaded the two *.MSA files for the Chaos demo from the Atari.archive. I successfully downloaded and unMSAed the two files to make the Chaos demo disk, but the disk directory and/or boot sectors do appear to be scrambled: the disk wouldn't self-boot or reach desktop, and checking it's contents from desktop showed weirc characters in the folder and filenames: a scrambled directory.

Has anybody else had these problems? Is there a patch? Or should I attempt to download the entire demo again? I checked to see if my disk was bad, unformattable, etc: the media was not the problem.

Thanks for your help, please e-mail replies rather than take up Usenet bandwidth. Bye now!

-Mark (markjl@acs.bu.edu or markjl@buengf.bu.edu)

5462. "Error in dialog format!" question

Newsgroup: comp.sys.atari.st
Date: 1992-11-15 20:04:13 UTC
From: ggranger@ersys.edmonton.ab.ca
Message-ID: <qXqauB3w165w@ersys.edmonton.ab.ca>

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

What causes the "Error in dialog format!" error in TOS 2.06? I am trying to run Paula via Petra on a 1 meg STfm w/TOS 2.06. I tried it with Petra running in the AUTO folder as well as in the root, but the same thing happened. When I call up Paula.Acc under the Acc, I get that irritating little dialog error.

From: warwick@cs.uq.oz.au
Message-ID: <11053@uqcspe.cs.uq.oz.au>
Source record: 214833

leo@dcs.warwick.ac.uk (Leo Hendry) writes:

>It is slow because Atari STILL haven't made use of STe's hardware scrolling
>(which I assume is available on the Falcon) in TOS.

The ONLY possible use the OS could make of hardware scrolling is in the pure
TOS text mode, and even then, it would be a pretty ugly hack. One use for
the hardware scrolling is in the implementation of BigScreen emulators - which
is nothing to do with the OS, and are already available. Even the ST can use
the bigscreen emulator, although only the 640xH modes are useful, and scrolling
is in 1280-byte chunks (ie. ie. 5 * 256 bytes = 16 line mono / 8 lines colour)

> The funny thing is that Atari recently complained about games programmers
>not using the facilities of the STe.

... and then didn't put all those features in the TT!!! Never mind, the Falcon
should be more attractive for developers.

Source record: 214835

automan@stein.u.washington.edu (Roger McGhee) writes:
{ Text about '...looking for ... Empire...' was deleted to save space. }

Does anybody know if Interstel will be releasing Empire Deluxe for ST/STe/
Falcon machines?

Also, does anybody know what the "Deluxe" version is supposed to have
included over Empire? Improved modem support would be great.

However, I would prefer more terrain and unit types. Like a fighter/bomber
that could carry paratroopers over cities. And light tanks that could move
two spaces but lack the firepower of the "infantry" (you know, the ones
that look like tanks :).

At one time, there was something similar to the above on the Unix boxes
here at the U. of Oklahoma. I can't remember what its name was. Anyone?

Oh yeah, I nearly forgot... I would like to see better computer strategists
and not the cheaters that they are now. They are WAY too easy to beat (even
on "Expert" setting with two computer opponents)!

Later,
Kenneth Love

PS: I'd hate to have to buy the game for my mother's Pissy Dog machine, but
I will if I can't get it for the ST.

Don't think so - you can't build boards like that by hand.

I've heard detailed accounts of a certain australian developer's machine - he's one of the very first to receive new systems, for certain reasons. The falcon he has is so early, in fact, that it has no DSP in it 8).

Despite this, it is a remarkably well-finished unit, and was indubitably machine-assembled.

BB> Indeed.. I totally agree that *VME* is a standard world-wide..
BB>
BB> HOWEVER.. the Atari implementation of that standard IS NOT
BB> fully compatible with the industry acknowledged standard.
BB> It's about as close to VME as "ASCI" was to the SCSI standard.
BB> For anyone with the standard Atari short-memories, Allan Pratt
BB> *acknowledged* that the Atari "VME" was not fully implemented,
BB> saying something like "maybe next time".

'Fully implemented' is a bit rough really - as far as I can tell, it does most of the 'standard' VME stuff - but there are dozens of different modes that can be used to access a VME bus, and I guess they don't support all of them.

BB> There may be *hundreds* of 3U VME cards in the world.. how
BB> many of those are of ANY interest to an Atari computer user?

The 'average atari user' doesn't generally need to add anything to their machine as it stands... This is in stark contrast to the 'average PC user' (which is where this pathetic whinge is aimed) who generally needs to stuff his/her pathetic interface bus with boards to get anywhere at all.

BB> (Actually, 3U is rarely used in the "real world".. the double
BB> height 6U card is the most widely available.)

There are a few problems with 6U - the main one being that the cards are even _more_ expensive, and there is _no_room_ in a desktop case like the STe/TT's for one.

BB> My message went on to ask if anyone out there has found any
BB> 3U cards that they've actually found useful..
...
BB> I'd really like to know if anyone in the "real world" has
BB> *EVER* found anything to plug into their (Atari)VME slot
BB> that did anything useful for them..

As I replied - yes. There is an australian company that runs a custom embroidery service, as well as producing embroidered tablecloths & so forth -a reasonably niche-ish market to be sure - but ask your average department store how many they sell - you might be surprised.

Anyway, they exclusively use TT's with 3U digital I/O boards in them - why? well, they've had so many bad experiences with PC's and the crufty

industrial control hardware that plugs into them, and they wanted to go VME, without paying $$$ for full cages & '030 processor boards. The TT was their ideal choice.

There are other companies, even in this tiny city, making a good fist of things with the TT and MSTe as _economical_, _reliable_ small VME host systems.

BB> In what way was my message "unfair"..?

You presume that the 'average' ST owner _needs_ to expand. Hardly a valid supposition.

BB> (A bit of background.. I use, and know about those "VME"
BB> cards for instrumentation and industrial control.. NONE of
BB> the ones I'm familiar with would even FIT into an Atari
BB> "VME" slot, much less be useful to the "average" Atari
BB> owner).

Then I strongly suspect that your background and experience is highly suspect. Just quoting from a PEP Modular Computers glossy I have here... I have full-page sheets/forpagers on :

VIOP : Intelligent parallel I/O module with 32 channels
VIOS : Intelligent serial I/O module with 4 channels
VLAN : Ethernet/802.3/cheapernet controller module
VADI : Analog/digital interface with 2KB FIFO
VDAD : Combined DAC, ADC and digital I/O module
VMFB : Multifunction board (2 serial, 16bits of I/O, 24bit timer, RTS, 64K of battery-backed SRAM, wakeup/sleep facilities, hardware watchdog, 6 programmable interrupt sources)
VMOD : Flexible industrial I/O interface module (accepts 2 of their plug-in "pigghyback" modules, or you can design your own - they sell a 20-bit DI/DO module, a dual-32bit counter (with trigger/inhibit inputs), a 20-bit input-only module (16 level-sensitive, 4 edge-sensitive), a 4-channel 12-bit DAC module, a stepper motor interface, an RS232 module, and RS422 module, an RS485 module, a 20mA current loop module, 4 different fibre drivers and a prototyping module).

These are just the boards I was particularly interested in. They're priced as you would expect VME stuff to be priced, from $400 to nearly $2000 (australian dollars - worth about 70c US)

I also have their 'full range' glossy : the cards that will fit 3U/A24/D16 :

VM20 : 68020 processor board w/8M of SRAM
VSBC-1 : 68000 processor board, one 1MB
VMPM68KA-2 : 68000 processor board
(these three have large amounts of assorted other functionality onboard)

VSIO : 2-port serial board
VPRM : prototyping module w/full documentation & license for reproduction

VIOC : VME <--> IIOC converter
VGPM : graphics card based on the 63484 (32/64MHz pixclock, 512/1M RAM,
display size full yprogrammable to 1024x1280, max 16 of 4096 colours)
VIMC : Intelligent motion controller based on the LM628
VMSC : MFM harddisk/floppy controller (wow!)
V1553 : mil-spec a/b controller based on DDC BUS-61554
VSCSI : SCSI controller (53C90 based)
VDOUT32 : 32 opto-isolated output channels.

BB> This sounds a lot like the time I asked if ANYONE actually
BB> had an "ATW"..

Hmm. Not really. Same tone of voice, I guess.

BB> BobR

Anyway, there you have it. Sounds like you missed a few in your 'research',
eh Bob?

2 points in closing :

1) PEP's address in the US is :

PEP modualr computers
600 north bell avenue
pittsburgh pa 15106

(I also have their distributor's addresses worldwide)

2) I am in no way affiliated with PEP, any of their distributors or other
associates - I simply have some of their material.

5474. Disassembler

Newsgroup: comp.sys.atari.st
Date: 1992-11-16 09:55:01 UTC
From: rogina@i13d7.ira.uka.de
Message-ID: <1e7r5lINNjet@iraul1.ira.uka.de>
Source record: 214840

Is there a disassembler which can disassemble plain code without program headers and that kind of stuff. The disassemblers from a.a keep crashing or telling me that they can only handle .PRG, .TTP, .TOS etc. programs, or they produce a listing which contains one data-statement.

Ivica Rogina, rogina@ira.uka.de

We heard from Aaaron on Fnet a few days ago that he fried his
hard drive. I think that he lost some of his stuff, though I do know
that he had someone else looking after his registrations for him.
I suggest you contact him again regarding reg.

Regards

Sorry to have to ask this, as I know it has been asked before, but at the time I had no problems !

I'm getting a lookup failure when I try to ftp to a.a, could some kind soul please mail me the actual real address for this site, now that it has moved, this question does not seem to appear in the faq, yet ! :-)

Many many thanks,

5478. Vi with Mint

Newsgroup: comp.sys.atari.st
Date: 1992-11-16 10:03:15 UTC
From: pdel@ADS.COM
Message-ID: <1992Nov16.100315.10615@ads.com>
Source record: 214838

Here's a weird one:

I tried editing a file in the current directory with vi (SteVi,or
something like that)

Seems if I don't have a '.' in the filename, vi doesn't see it and
opens up a new file instead.
If I edit the new file and save it, vi puts a '.' at the end of the
filename.

I've gone to different directories and tried this, with the same
result.

If I exit mint and run gulam, then the vi editor works fine.

Is there some kind of variable I'm forgetting to set in Mint?

thanks for help,

PD

If you can perswade the host machine to accept incoming serial bytes
as if it came from the keyboard and to echo anything printed to the
screen to the serial port then you can do this with a null modem cable
and a terminal emulator. On a BBC or Arc this can be done with a couple
of *fx calls and works very well in command line mode, although to be able
to use the desktop you would need to write a VDU driver for your ST and have
some way of moving the mouse.

>fact that `nobody uses the STE hardware scrolling'.).

I know that the screen start address to be varied by a word at a time allowing
vertical scrolling by adding/subtracting the number of bytes in line times the
number of lines you wish to scroll by.
I don't know whether you can specify a vertical offset (where the screen
starts scanning at the screen address+offset and after reaching screen
address+size of screen continues at screen address), but probably not since
this can easily be done in software using the timer B counter.
In the case of horizontal scrolling you can specify both a horizontal offset
and a number of bytes to skip between scan lines to give a virtual screen
wider than the one displayed.
Of course, these features only apply to the whole screen - to scroll in a
window you must use the blitter, which should be fast enough, however many
programs just redraw the whole window when it is scrolled (Which can be faster
if no blitter is fitted).

5488. Mouse wander - acceptable?

Newsgroup: comp.sys.atari.st
Date: 1992-11-16 14:49:27 UTC
From: otv@hal.nta.no
Message-ID: <1992Nov16.144927.4216@nntp.nta.no>
Source record: 214753

My ATARI dealer sold me a mouse for my STe 1040 which frequently starts to wander around the screen by itself - without me touching the mouse. The problem is of course that in some programs, if it pulls down a menu, the program will not respond to keyboard inputs.

My dealer tells me this is common to all non-atari mice, and is due to "very strong signals from the mouse". In my opinion this has rather to do with "very much noise from the mouse". Should I accept what he says, or is this behavior of my mouse unacceptable? Any authorized opinions are very much appreciated. Thanks in advance!

<< rest deleted >>

Mike, since you asked, "CyberDrome-The Hoverjet Simulator", is compatible with all ST, STe, TT machines with 1Mb or more RAM and color monitor. It is hard disk installable and while the disk is serialized, it is not physically copy protected. Our demo (available on atari.archive) runs on the Falcon but we have not developed a Falcon-specific version (yet). In the two-player/two-computer mode, your 8MHz ST can play with a 33MHz TT (via modem or null modem cable). The Atari versions will be link compatible with the PC version too.

Detailed info about "CyberDrome-The Hoverjet Simulator" is available via email.

I received my .KEY about a week after paying, there must be some misunderstanding here I believe. I sent 15 pounds to Ben Van Bokkem in England and he put my .KEY file as F-Mail at his BBS. That's the way you have to register in Europe, so I don't know about the US. Anyway, I don't believe Aaron is a crook.

My friend once had this same problem, and it could momentarily be
helped by pushing the mouse connector better into its plug. To solve
the problems for good my friend had to have his mouse-port fixed, it
had become loose because he had switched the mouse and the joystick
back and forth so much. So if your mouse connector is steadily in the
plug and the problem still occurs your mouse port might be out of
order. Or maybe the problem is with the mouse itself or its connector.

Well, mine is not an "authorized" opinion, but an "opinonated" one, anyway. :)

Sorry, I don't buy your dealer's explanation. I've used a couple of third
party mice on the Atari and none have exhibited this behavior. If you are
running some kind of screen accelerator that also speeds up mouse input, you
might try disabling that. If that doesn't work, get a refund, a new mouse,
and/or a new dealer.

Just a quick couple of questions:

1) Did you ask your systems Postmaster what the error messages included with the rejected e-mail message implied?

2) Did you ask your systems Network Administrator if there were problems with the international connections between New Zealand and the United States during that time period?

3) Did you ask ANYONE at a local level if there might have been problems with the networking capabilities of your computer system during the time in question?

Before making a whomping generalization about an FTP service, it would be best to inquire, gently, whether the rest of the world has been having similar problems, or if it just from your small part of the world that things have not been running smoothly.

Your e-mail message could have been readdressed to Jeff's new addresses, which he's posted at least once in this forum since he started graduate school at the University of Minnesota, in late September.

Anyone attending the COMDEX show in Las Vegas this week, please post the news that you obtain!

Sam Tramiel is suppose to have a GEnie conference online at the show in which he will reveal information on new products and software!

Please post ANY INFO that you have.

Thanks.

Len Stys (aa399@cleveland.Freenet.Edu)

I don't know all system calls used by the standard X Server (it's been a long time since I last installed one), but you'll probably have the most difficulties with the socket-related stuff (MiNT doesn't have sockets, yet). If you *really* want to do this, IMHO it would be easiest to replace the sockets by FIFOs; that way you could at least run clients on the ST.

Jens.

Oh well, posthumous smily.

Of course 286's are still available... I was just spoofing roger, who's
always telling us about how "you don't see STs in shops anymore, and
NEVER see advertised." Just as you see 286's in shops, I also see STs
in shops.

Hermes will do all that you want. Try looking for HERM104B.TAF on
(preferable German) ftp-Sites!
You are able to used the GEM based Newsreader GUS or the old 'rn' from
the Mercury package. But there is the 'nn', too! After installing Hermes
you should try to install *the* Net Newsreader (current Version 6.4.11
1.3 ST?!)

ggreenbe@rodan.acs.syr.edu (Gerald Greenberg) writes:

>Here's an idea for all you programmers out there...what about
>a program that will allow one to control another computer,
>remotely via a modem?

How about this scenario:

In the morning, you leave home, and insert a certain floppy in your drive, or
set-up a certain auto-run program on your harddrive. And turn your computer on.

Then, from work, you dial you home phone, and let it ring ONCE, wait ten seconds,
and do again (once).

The program (which has been monitoring the modem for the "RING" signal all day
responds by ringing the dial-in lines to your workplace, and sets up the
connection between computers, perhaps in a restricted fashion (eg. the home
computer will only execute certain programs, unless a password is given, etc.)

I'd be happy if the program just downloaded files and unpacked them, so that
I can send stuff home and have it arrive before I do...

These days I just use the Sparc's floppy drive, but the above is a nice idea...

What a load of it.

I have a non-atari mouse that also exhibits this behavious. It is a "xydexzc"
(or something like that - white with orange symbol/name).

It has a switch on the bottom to switch between Amiga and Atari mouse. And guess
what - it exhibits similar behaviour on the Amiga, except that there it vibrates
rather than wandering, but that's just the different way Amigas and Ataris
use the 4 mouse input lines. (ie. on the Atari, the mouse is oscilating the
"move now" strobe, while on the Amiga, it oscilates the "direction" strobe,
effectively)

It doesn't bother me... much.

Make sure you've got the number of retries spot in the dialer setup dialog
filled in.

If you leave it blank, Uniterm will continue to redial forever. (Pressing
any key only aborts the current attempt, not the whole sequence.)

5515. Ghostscript 2.52 beta: 8-bit and fax drivers.

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 04:14:19 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <83792@ut-emx.uucp>
Source record: 214770

Hi,

For those who downloaded the beta version of GS 2.52 only to find out that 8-bit color didn't work, there is now a new executable on lifshitz.ph.utexas.edu (/pub/atari/ghostscript/beta/gsfix.zoo) that has at least one 8-bit bug fixed. The archive containing GS support files also contains the updated executable. So, if you tried 8-bit color and got two bombs, you might want to try again. Due to the fact that I cannot test 8-bit color on my ST, I still don't know whether this fixed code works.

Also, GS 2.52 contains a fax driver which I modified slightly to produce (supposedly standard) G3 format. I would like to hear whether anyone is able to use this output.

I have been able to disassemble plain code with DIS2ND. Yes, it does say
that it can only disassemble .PRG, .TTP, .TOS, etc. However, it can tell
that a .PRG is not a normal program if it doesn't have the normal headers.
So rename the file with the plain code to .PRG and disassemble. The
output will go to the root of the drive that you specify. (I have used
this to disassemble boot sectors.)

Warwick,
They do still here (286), and you can get a 20mhz motherboard for about
$nzd100.00. A meg a ram (SIM) is $nzd64 so a cheap pc (grin), or
upgrade for the ever popular XT.

NZ does carry all the comp.sys.ibm groups either under OS.msdos.apps
or os.os2.* etc etc .... Ask you sysadmin for further help on the'
subject (Was it Roger who aked this?)

As an aside a 286 makes a good comms server for your ST with
things like "Aquaduct".

Na just leave this OZZy alown, he might find hime self a Gin Jockey and throw
his Atari away...

By the way I don't have a PC, but the firm that I work for just brought
a 286, I was hoping for some HELP here, but all I get is insults, is this how
you all feel about your Ataries...??..

May be this is food for thought, MAC's outsold IBM PC in the last 6 months
here, and I do mean IBM and not Clones...???

One day I will get a ???, Acorn A5000, ? or PC, or A1200 , tell me chaps where
should I go. ..??? NO RUDE REMARKS PLEASE...:-)...

One of the 5 million sheep...

Roger..... sheppard_r@kosmos.wcc.govt.nz

I've once read in a dutch magazine about Genius mice having this
problem. The solution to it was a minor modification of the mouse.
I might be able to dig it up somewhere...

5521. Cad 3D gem message pipline, wheres doc's?

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 07:46:41 UTC
From: wilsont@rahul.net
Message-ID: <Bxuo9u.917@rahul.net>
Source record: 214782

Long ago when the Catalog existed i remember a cad3d developers kit
or something like that.
It used the GEM messages to communicate with ACC's that would control Cad 3d.

what i want to know is, if there is a set of these messages/commands
that i could get a hold of?

i haven't seen it in stores. anybody have them?

i don't want to program cyber control, and i'm too poor to buy Chronos.

help!

Thanks!

-Timothy

Gee, sounds like a BBS to me... I think Gerald wanted something with a
GUI, though...

If he has another ST, and the patience to work with IGS, he could set
up a BBS with instant graphics menus and such, or if the ST ever gets a
good X-server, he could call it with any X-terminal.

Of course, neither of these allow you to run GEM applications from a
remote computer... Maybe someone would like to make a remote access
program for the F030 or MiNT/TOSwin?

>My ATARI dealer sold me a mouse for my STe 1040 which frequently starts
>to wander around the screen by itself - without me touching the mouse.
>etc....

I have a similiar problem with my mouse and it's an official atari one,
what usually happens is that the cursor will be quite happily sitting
in the centre of the screen and then will suddenly decide that the top
of the screen is more interesting and move up there. It's very
odd and I really can't see any reason for it.

Anyone out there know why this happens? I can't see why strong signals
would cause a problem really. Is is a fault with the keyboard chip?

Mark

5524. GDOS drivers for color printers ARE available

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 09:56:55 UTC
From: CASTAN@cip.physik.uni-stuttgart.de
Message-ID: <1992Nov17.095655.15671@news.uni-stuttgart.de>
Source record: 214785

Hello,

I remember that a developer said that there was no printer driver package
(source) for color printers.

Maybe. But if you call the EXTENDED INQUIRE FUNCTION (VDI 102) for the
printer drivers in the FontGDOS package, you'll notice that there ARE
printer drivers which support color.
(NX1000.SYS, OKI20.SYS, PAINTJET.SYS with 3 planes = 8 colors each)

Has anybody tried to use PAINTJET.SYS for the deskjet 500 C?

Gerd

Sender: bgilbert@cs.washington.edu

The Falcon should work just fine with any Multisync out there -- it is
made to hook up to any VGA monitor, and a multisync is just a more
expensive (and better of course) way to do VGA or Super VGA. If you're
going to get a moinitor, I would recommend a multisync over just a plain
VGA, for the Falcon anyway. For the Mega STe it's just a question of
being able to do all the modes on one monitor, which you definitely need
a multisync for.

5527. New TOS versions?

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 12:26:27 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Nov17.122627.16049@crc.ac.uk>
Source record: 214787

As I understand it, things like NVDI and Warp 9 replace parts of TOS which was written in C, with bits written in assembler, which is faster.

Would it be possible to rewrite the whole of TOS in assembler, and would this make it faster than NVDI etc?

Just curious,
Phil
(E-mail naffara@uk.ac.crc)

Having just read this months ST Format and ST Review (the best one), I thought
I would post some interesting info.

They say that the Falcon030 will be *widely* available next spring.
(Most of us knew this already) But in a new case.
BTW I thought the specs said the 030 was a 32bit computer, not 16bit like some
people are saying. (we'll just have to wait and see!)

Also a Falcon040 with 32Mhz 32 bit processor + DSP etc will be *released* next
November and be available spring '94.

Also being released at the same time will be a CD Falcon which will have either
a cut down keyboard ie no keypad or F keys, and have a built in CD ROM which
will probably be CD-I compatible.

There was also some talk about the software being produced for the Falcon.
(the graphics look incredible, especially the pics from Legends of Valour!)

Desperately wanting to get hold of a Falcon in a new case,
Phil

5532. TT and llamatron

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 15:39:41 UTC
From: <>
Message-ID: <bnell.722014781@protege>
Source record: 214709

Hello out there,
I was under the impression that llamatron worked on TT's (as long as you had some sort of 24-bit MMU program). I've downloaded the llamatron on a.a but it doesn't work. I've tried removing every TSR, .ACC & .CPX, turning the cache off & on and anything else I could think of. My TT has 3.06 ROM so there shouldn't be any OS bugs causing the problem. So... does llamatron really work on the TT or not? And if it does, then what is wrong with my copy or (god forbid :-) my TT?

Any help would be appreciated,
Bill

I have an ATARI mouse and it shows the same effects. Maybe it's the
connection to the mouse-port rather than the mouse itself.

5536. Ramdisks, submariners, and CAD 3D help: thanks!

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 16:28:33 UTC
From: rrk@vixen.cc.bellcore.com
Message-ID: <1992Nov17.162833.1654@porthos.cc.bellcore.com>
Source record: 214701

Thanks be to the net. On my recent inquiry on ramdisks
I received several helpful responses, and as a result
I grabbed several ramdisks from the atari archive. (the
address for which I found in another posting since the
one I had did not work).

Similarly, I found out Tom Hudson is still performing 3D magic
with Autodesk. Pure talent. (I also will call Lexicor for a
catalog)

W.R.T. G+plus and CAD 3D hardcopy: I had called
the Codeheads about a year ago, they suggested a different assign.sys
printer driver as I recall, it didn't help. Apparently the problem
was not common, they had dealt with it only once before, but did not
recall the solution off-hand. So anyway, I would like knowing
if someone has used G+plus with CAD 3D (2.0) successfully so I know
whether or not to keep trying.

Finally, I received an enthusiastic response for Silent Service 2,
and it will be my next software purchase (I've seen Joppa advertise it).

Anyway, thanks much. This net is a great resource. Also much
thanks to those who maintain the atari archive.

>you all feel about your Ataries...??..

Actually, I would tend to guess that many folks feel a bit, er, confused by your request for IBM-clone information in an Atari ST forum. Such questions are usually best addressed by posting a message in a newsgroup which actually deals with the Intel-clone machines -- one of the comp.sys.ibm.* groups should do nicely.

Since you've made your own animosity toward Atari computers well known, many might interpret your request in a, shall we say, negative manner. It's not as though you haven't posted your share of insulting remarks along in this forum ...

-- David Paschall-Zimbel

N.B. I'm getting to enjoy the 15 megabyte installation of MicroSoft Word for Windows at the site where I work. It's nice to see that the Intel-clone market is rapidly bringing down the price of large-sized disk drives. :-)

5540. Calamus v1 -> disk -> LJ?

Newsgroup: comp.sys.atari.st
Date: 1992-11-17 17:26:14 UTC
From: Joshua Kronengold <JOKHC@CUNYVM.BITNET>
Message-ID: <92322.122615JOKHC@CUNYVM.BITNET>

Of course you were (grin).....

Spotted at lake taupo last weekend ... Many STE's in a shop along
with a 286, Amiga 3000 and LOTS of Atari software..

Whites Music store is the name for those venturing into the bowles
of the central north island.

Message-ID: <17NOV92.13220296@cc4.crl.aecl.ca>
Source record: 214704

Anyone considering upgrading an ST to a 1.44 meg drive should consider purchasing a 21 meg floptical; I did. No AJAX chip installation or drive installation. Just plug the drive into a LYNX connector and boot with ICD's version 6 software and your can read/write 720K, 1.44 meg and 21 meg disks on the same drive. The money you save on not getting the 1.44 meg drive takes you well along the way to buying the floptical.

|
| I'm no expert, but have a non-ST mouse myself and never had this problem.
| I personally wouldn't accept this (for what's that worth...:)
|
I used to have a Genius mouse, and it DID display this behaviour (Genius mice are in fact notorious for it) - the mouse used to wander off in a straight line until actually moved by hand. From time to time my ATARI mouse has done this too.

I am interested in upgrading to a system that I can project grapics from an NTSC projector. Do the STe/Mega have straight video out as well as the modulated, or is it possible to get at the video signal and bring it out to it's own connector?

I am also interested in the expanded video cards that I have seen advertised for the Mega. Has anyone any experience with these?

Thanks in advance...

|
OK, I think I know the game. Pick a colour. Now use the tetris-style blocks to cover up all the balls except the ones of your chosen colour. I believe you have to do this with all the colours to win. I couldn't be bothered at the time as my mouse was broken and I had to use ALT+cursor keys (and the program thoughtfully turns off the keyboard repeat).

Well I read an article on Empire Deluxe in a magazine whose name I forget ("Strategy Plus"?). There are some new pieces (armor, bombers, airfields), configurable worlds (wrap around), Explore mode (versus random), better modem support and possibly network support. I hope that helps. No word if this will be availble for the Atari. Also don't think it's from Interstel anymore.

I am posting this for someone who does not have Usenet access. If you
follow up to the Net, please also send your reply by mail to best@rijnh.nl.
(The Reply-To: field is set to this.)

Please help to get information about network software for Atari TT in
a UNIX environment.

I have got FTP.TTP, TELNET.TTP and XTT.TOS from PAM Software (Mainz,
Germany) on a TT with internal (standard VME) ethernet board.

FTP works reasonably well. TELNET emulates VT52 only.
FTP and TELNET lack a history function.
XTT is a beta version of X-server software (X11R4).
It turns the TT into an X-terminal on a Silicon Graphics mainframe,
works well but has some bugs.

One problem is that PAM seems not to work on any updates.
Atari has X software, but only for there own network, I was told.
Other problems are that I'd like to have lpr, xterm and xhost on the
TT, but that seems to be impossible (multitasking?).

Could anybody advise me?

5557. Falcon In Australia

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 03:17:28 UTC
From: s883334@minyos.xx.rmit.oz.au
Message-ID: <1ecck9INNb18@escargot.xx.rmit.OZ.AU>
Source record: 214720

Attening the Home Computer Show in Melbourne last weekend, it was surprising to see Atari having one of the largest and most prominent stands. On display were two falcons, and a 1040 St with midi setup (singer, lights, tone modules and electric guitar). One falcon ran a continuous slide show, whilst the other was used for DSP sound demonstration.
Atari had sessions where the performed a full song (Ive still got the blues for you) with the singer, guitar, tone modules and lights. After getting a crowd gathered, they then spoke briefly about the St and its midi capabilities and then went on to demonstrate the sound digitising capabilities of the Falcon. This consisted of a member of the crowd singing into a microphone the song then being played back with various effects such as delays etc. The Atari guy then spoke through the microphone demonstrating real time sound effects that can be achieved upon any input sound. It would have been nicer to see this done with music rather than voice.

I was told the Falcon will be available here in Australia at the end of January, for between (AUS$) $1000 and $1500 (I HOPE this upper end price is not for the 1 meg, no HD machine). I also asked someone from Dick Smith (the main retail outlet of atari in Australia) and was told the price would be around $1000. At the show, Atari was selling 1040 STE's for $499! $400 less than their normal price.

I like using Templmon. You install it as a tsr, then you can activate it
anytime with ctrl-help. It works on most programs, as long as they don't mess
with the break vector, keyboard vector.

If you have a sector editor, you can change the first instruction in a .prg
file to an illegal instruction, then when you run the program Templmon will
take over.

Source record: 214472

JL> mikenet: this looks to be the newest of the shareware lot, but the .arj
JL> file at umich has 3 files, but the docs hint of more.
I think you might be missing MKNT.TTP using which you can change the Mikenet setup via command line (you could change over partition setup at the start of a certain shell-script that needs a partition, that you usually do not need)...

JL> It runs fine on the mega but gives 3 bombs on the 1040... any ideas at all
JL> on this one?
I had a problem like this in the beginning and got a solution suggestion from Mike that should work (even I chose another way of getting around this).

MikeNet works with 32MB BGM partitions, but there is a small think you have to look at, to get it work properly.
As I understand from your description, you can access 1040-partitions from your Mega, but not vice versa. I think that your harddisc on the Mega contains (at least one) BGM-partition, while the 1040 doesn't have such a partition.
-> Problem: Due to the BGM partition on the Mega, the "max logical sector size" of the Mega is set to 2048bytes, while on the 1040 this limit is set to the "normal" 1024 bytes.
When Mikenet sends data from the Mega to your 1040 it sends 2048-byte sectors - a size, that the 1040 cannot handle as long as its max sector size is 1024.
-> Solution #1: Set the Max sector size on the 1040 to the same value as on the Mega (ICD-Boot could do this).
-> Solution #2: Change over your partition layout with BGM partitions on either *BOTH* or *NONE* of your computers.

Hope it helps...

yours,

Benedikt

Source record: 214473

>> I have Silent Service 1. Is Silent Service 2 an
>> improvement worth the $45 it costs?
TG> Yes.
TG> Nice graphics, good sound, and you can run it from harddisk!

Nope!
It definately didn't get any harder or more realistic. The old one is still
enough - I think. The only real new items are:
- you can choose your sub yourself now
- you can play a campaign with several patrols in it throughout the war
(and see the tonnage that you would have sank in a whole war rather
than only seeing, what you could have done on a single patrol).

Sounds/Graphics got better than the SS-I, but on the other hand the "enemy
intelligence" became by far worse than in SS-I.
(For example: Scenario "Cavalla" tried
10 times tried in SS-I -> 1 time victorious
10 times tried in SS-II -> 7 times victorious)

So - save your money for another purpose than buying SS-II!

yours,

Benedikt

And doesn't work on the TT. It was written, I seem to remember, with GFA
basic - so with any luck there will be an update comipled with a later
version.

5569. Accessing joystick from 'C'

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 09:32:45 UTC
From: cabp09@ccsun.strath.ac.uk
Message-ID: <1992Nov18.093245.8277@ccsun.strath.ac.uk>
Source record: 214728

Hi there,
Does ANYONE out there know how to read the joystick ports
of an atari ST in C/Assembly ?? I presume there must be tonnes of
people out there.

Also, I've been using Bcostat() to check if the input is
pending from the keyboard, but is there a way of readin 2 or more
keys "pressed at once" ?? ie is there a keyboard buffer, do I need
to switch off the auto-repeat thingy (if so how).

Thanks in advance,

Dave.

PS: Be gentle, it's my first time (??!!?!??)

There exists a PD software called WINX that is available from MAXON
PD service in Germany. I do not know if the thing works with a
futuer MultiTOS that will not have the 7 window limits either.

Hi,

Can anyone recommend a good technical word processor for the ST. ie. one that
would allow me to enter (large messy) equations (easily)? and also have the
ability to generate table of contents, tables etc or am I asking to much?
(I suppose I would be looking for something like word for windows 2 for the PC)
(apoloyises for mentioning PC in this group :-))

5572. Help with RCS created .RSC file / header

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 10:37:45 UTC
From: davem@extro.ucc.su.OZ.AU
Message-ID: <davem.722083065@extro.ucc.su.OZ.AU>
Source record: 214730

I'm trying to use the Resource Construction Set V1.4.
Say I have two trees defined, say a menu and a dialog box, and the dialog box
has on OK button. How do I use rsrc_gaddr to get a pointer to the button?
If I give the button a name eg OKBUTT, the .H file produced by the RCS defines
it as 3, as it is the third object i tree #1 (The menu is tree #0). So
if I do rsrc_gaddr(1,OKBUTT,&buttpoint) I get a pointer to the third object
in tree #0 (which happens to be the Desk menu title). So how do I tell
rsrc_gaddr theat I want to get the third item in tree #1, not tree #0?
Do I have to calculate the offset by counting the number of items in tree #0?
Or is there a more elegant way? Am I missing something obvious?

Thanks,
David Monro

Also, anybody else having problems launching this version under
tcsh? It works just fine until it says "copy to transform array"
at which point it just exits. It does work under MiNT from another
shell (tried with Okami) and also from TOSWIN and presumably
from the desktop too, though didn't think to try this. As a wild
guess, could it be a memory problem? I do have a 4 meg system
though.

Well ... right here in sunny Strathclyde we have TeX - the document processing
package.

It's not like 'Word For Windows' but more like a document compiler.

You write a document in ASCII then compile, and hey presto, a postscript file
appears (well ... you need to use a utility called dvi2ps !!) which can be
dumped on any laser printer on the SUN network at Strathclyde.

I'd advise you to use LaTeX (a sort of macro package for TeX) ... with this,
I produce all of my handin's and lab reports !!

ITS FAB !!

Oh, and if your wondering what this has to do with the ST, I have an
implimentation of TeX running on my old 1040ST with no probs (mind you,
it does need 2 1/2 megs of HD space to store fonts/binaries ... etc)

Dave.

(PS: perhaps this should be in comp.text.tex - my apogologies !!)

|>

Yeah, well my question is how does one get msa to work on a 520ST with one floppy. Last I was trying to unpack some demo from a.a.u.e i gave up after the 40th disk swap or so.
How could anyone write such a stupid program that doesn't make any use of the ram memory available and just reads one single track/side, unpacks it, asks for diskswap, writes it, asks for diskswap etc.

Please, tell me if i have missed something or else stop packing disks with this stupid packer. There are much better packers avalable.

5579. Atari seen in Compuke! magazine

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 12:51:20 UTC
From: kllove@wildcat.ecn.uoknor.edu
Message-ID: <Bxwx1n.9H5@constellation.ecn.uoknor.edu>
Source record: 214613

The November issue of Compuke! mentioned the Atari Portfolio in one of its articles (the one on palmtop computers). The author did a price/feature comparison of several palmtops. If you are looking for an entry level palmtop computer, I don't see how you could choose anything else. Is this just news to me?

The December issue had a company trying to teach you about music on computers. They were giving away an ST when you payed their tuition. Their was even a 520/1040 style case (couldn't tell which because of the small picture).

On a side note: among the "101 Things to Give for Christmas Presents" was an Amiga 500. They said it's great for games and even runs a few serious applications. Was this a back-handed compliment or what?

I thought I'd never see the day when Compute! (er... Compuke!) magazine gave any non-PC or non-Mac the time of day. The end must be near...

Anybody care?

Later,
Kenneth Love

Um... What constitutes serious use to you? I call the DECs here at school
with VT100 all of the time to do things like reading c.s.a.st (important! :),
edit files (with vi of course), and generally muck about.

What am I missing with VT200? I don't need Latin characters to be displayed
on my screen (couldn't read 'em if they did show up). In other words, what
kinds of uses are there for VT200 that aren't covered by VT100?

Just wondering,
Kenneth Love

5583. Reply to Matt (floptical)

Newsgroup: comp.sys.atari.st

Message-ID: <18NOV92.08563151@cc4.crl.aecl.ca>
Source record: 214741

Flopticals plug right into any machine with a SCSI port; like the TT. If you have a DMA port (like any ST/STE), then you need the ICD LINK DMA-SCSI cable. With the LINK cable, just plug in the floptical to you hard disk port, boot with the ICD driver that comes with the LINK and that's it. You now have a 21 meg floptical that, as far as your computer is concerned, is a hard disk! In addition to the 21 meg disks, the floptical reads 720K and 1.44 meg floppies. One problem, if you have TOS 1.2 or less, programs will not run from the floptical.

alt.znet.pc was 'x'd at many sites due to a misunderstanding when it
was created.

You saw the announcement because it was crossposted to this newsgroup,
and therefore made it past the "junk" switches.

Well, word processor is actually not the correct word for it I guess,
but you might try to use TeX... (ctex f.i.)
It has all you want, and provides wonderful output, but it requires
some study.

llamatron BASIC version DOES WORK ON TT at least in mine does with
following configs (weird ones too)

st- low
cache off
from the cpx menu turn off cache too and INTERNAL SPEAKER OFF
connect the rca-plugs to your stereo on turn it on...

now the lamatron should work...

(I know the config. sounds weird, but at least in my tt llmataron bombs
2 bombs after the intro screen if you do not have the rca-plugs
konnected) -weird ha ?

5597. 21 meg floptical

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 17:05:17 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <18NOV92.12051755@cc4.crl.aecl.ca>
Source record: 214747

Netters, please READ postings carefully. I said LINK cable not LYNX cable. Also, if you do not have a SCSI port you MUST use the LINK cable to convert your DMA to SCSI (the LINK cable lets you use most SCSI peripherals without the need for a host adaptor (the ICD host adapter converted SCSI to DMA).

> will not run from the floptical.

So how do I find out what version of TOS I have? I suspect it could be less
that 1.2....it's a pretty old MEGA ST4.

What would I have to do to upgrade, if need-be?

-Matt

The LINK is a new SCSI/DMA host adapter from ICD which is in the form of a port adapter, no longer a board. You plug it on the SCSI port of your hard drive, Syquest, Floptical, etc and plug your DMA cable from your ST into the other end. Pretty slick, I reckon.

Ref the flopticals, I'd suggest you call the dealers marketing them. One is Purple Mountain Computers in Bellevue, Washington... (206)747-1519. The other is Toad Computers in Baltimore, Maryland... (800)448-8623. Either one will be better equipped to give you the tech specs and latest prices.

>over my Christmas break, but I will not have access to the net from my home.
>Could some nice guy help me (a relativly inexperienced programmer) out with
>the basics for C programming?

First suggestion: do NOT get GNU C/C++ to learn about C programming, at least not until you feel comfortable giving up 5 megabytes of hard disk space for the compiler and spending an hour or two setting things up correctly. For the absolute beginner in C programming, I would recommend using Heat&Serve C (Ian Lepore's easy-to-install-and-run version of Sozobon C). You can get hold of the program from the atari.archive.umich.edu FTP site. The file name is

atari/Languages/sozo133i.zoo

As to the basics of C programming, go to your local bookstore, find the computer language section and look through the "Learning C" books to find one with which you are comfortable. SAMS has a nice series of books, the first titled (of course) "Learning C". Ignore books about Turbo C, MicroSoft C and, for the moment, anything from Dr. Dobb's (after you've gone through an introductory book, you can try the more daunting code in books from Dr. Dobb's...)

About the only difference you'll find between Heat&Serve C and the C in the introductory books is where you get into ANSI-standard specifics. Learning the basics is pretty much the same whether you're using Portable C or ANSI-C.

Once you've started getting comfortable with C, you can start using the Power Versions of C (GNU C, Pure C, etc...) Some of the C compilers will cost you a lot of money (Pure C was in the $450 range last time I checked, GNU C is freely distributed).

When the MiNT/GNU C/shell/utility distribution kit is finally uploaded onto atari.archive.umich.edu (it's on hold at the moment, Simon, hint hint...), you shouldn't have quite as much of a hassle using (or installing) GNU C.

You should probably start saving for a hard disk if you don't already own one. A 20-megabyte hard drive is going to be cramped -- check out the additional costs of a 50-megabyte hard drive -- especially if you're going to play around with GNU C. The resulting program code is fairly large compared with other C compilers.

I hope this is the sort of information you needed. Feel free to ask for more information in this forum.

> I have a ICD controller of some sort and a 50MB hard drive in my
> Mega4, does that mean I can tap into that, or do I still need that
> "LINK" cable?

> Also, just like in the other thread: can you suggest sources/prices for
> the hardware?

I would contact ICD for exact information, (815) 968-2228 ask for Howard.
But I have connected multiple external drives to my ICD AdSCSI+. The
50 pin cable runs from the host adapter to the dirve in the case to the
external 50 pin SCSI connector. I use an external terminating resistor
that is inside a SCSI connector hood. So I can just daisy chain SCSI
devices, moving the terminator to the last drive.

I know that ICD will only make their CD-ROM software for the ACSI port
available with either the LINK host adapter, or the Professional version
of their software. It may be the same for the floptical software, but I
recommend calling ICD and verify.

5602. DMA-Sound with GFA Basic

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 19:27:22 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1ee5eqINNl03@golem.wcc.govt.nz>
Source record: 214602

Is there any way of re-directing the DMA sound output in GFA Basic to a standard STFM-output?? As, trying to program samples into the program using DMA sound, without being able to hear them is a major problem!

(Or, is there a way around it???)
/
Also - does the DMA play the samples in stereo??
(the DMA-sound command that is, I know the chip itself does!)

5603. g++ / MiNT distribution

Newsgroup: comp.sys.atari.st
Date: 1992-11-18 20:16:37 UTC

> shouldn't have quite as much of a hassle using (or installing) GNU C.

Yes, I know it's late. Sorry people, I've been descended on by a mad supervisor who wanted to know where I've been for the last 4 days :-)

I'll get it done RSN (honest). There's a problem which manifests itself in the minixfs part of the setup program. I minit the drive, make a large directory tree and then MiNT invalidates the drive (!) Consequently, nothing more may be copied to that drive. Ever. I think I sorted this out last time by insisting on a reset halfway through the install procedure, so I'll try that. Icidentally, I'm using the ICD software, it could possibly be that it doesn't expect a media-change on the hard disk...

A few details, though, for those who hunger... There will be 3 'operations' split over 2 programs. There is a Setup program, which you will only have to run once, hopefully, which (optionally) minit's a drive and then sets up a dir tree a la un*x, puts MiNT in your auto folder (actually it mucks around quite a lot in the auto folder, and with accessories etc. - unavoidable I'm afraid), and copies toswin stuff onto C:\

Secondly, there is a Install program, which lets you install software in related subsets. You *can* install parts of a subset if you want, but in future I'll be assuming that if any of a subset is installed, all of it is. This program is completely self-contained, and will be used for patches/updates as well as the initial install.

Thirdly, the Install program will let you run shell scripts for /bin/sh. This is how I intend to do do commands like chmod/chown etc. Any subset disk with a file called 'preXXX.sh' must be run before installing subset XXX, and any file 'postXXX.sh' must be run after installing subset XXX.

All of this is 'point-and-click', so hopefully there won't be too many problems with actually doing it. There's online ""help"" <--- (heavily quoted) which gives a brief description of what is in each subset.

I'm currently up to 10 disks including one for the setup/install programs. This should be taken with a pinch of salt. Due to the 'subset' nature of this new distribution, I can't pack them as well as I used to be able to...

Simon.

>
> Would it be possible to rewrite the whole of TOS in assembler, and would this
> make it faster than NVDI etc?

Sure, but it'd be a pain in the rear, changing the system would be next
to impossible, and bugs would be VERY hard to find and fix.

With a good C compiler, it's not TOO far from hand-hacked assembly
(maybe 20% slower than the code of an average assembly hacker)... I
doubt there'd be much advantage to it, and it'd be a lot of trouble (and
time - which would take some of Atari's few staff away from making new
products)...

As 3rd-party products, that kind of thing is pretty useful, though.

Source record: 214616

I'm looking for a program or DA that will allow me to view a series of .GIF files without interaction from the user. I have GEMView, which loads a single .GIF quite nicely, but what I'm looking for is something that works on a large screen, and loads one .GIF and displays it while loading the next, much in the same way as the old Spectrum viewers/slide show programs worked.

Has anyone seen any such animal? If so, where can I get it?

It would be POSSIBLE to write all of TOS in assembler, but it's not worth it since they'd have to rewrite it for each processor in use. As it is now, many of TOS's routines are in assembler with the rest written in C. They're going to be using Lattice C from now on to develop TOS, by the way.

The
Falcon030's 68030 has a 24-bit address/16-bit data bus. It get's a little confusing, though, because the COMBEL (the system controller) has a 32-bit bus to RAM and to the VIDEL (the video controller). The machine on the whole, though, isn't a 'TRUE' 32-bit machine (kinda like the Mac LC II/Performa 400). The PDS (processor-direct slot) is also 24-bit address/16-bit data. There is some hope, though, that a third party will be able to 'fix' this (there will, most definitely, be a 32-bit FAST RAM expansion for the Falcon030 that will allow more RAM, at least, from what I've heard).

You should also be aware of a shareware package that steps you through the basics of learning C. It is written with an MS-DOS slant, but I found that nearly everything ran under TOS with the exception of some stuff that depended on the MS-DOS display. Look for the files c-tutor1.arc and c-tutor2.arc. They may be on atari.archive; I know that they are on wuarchive.wustl.edu under /mirrors3/archive.umich.edu/msdos/programming/c and since that is a mirror of archive.umich.edu, it is probably under msdos.archive.umich.edu as well. There is a c++ tutorial kicking around as well.

Once you have the pointer to the tree:

```
OBJECT* Tree;
rsrc_gaddr... Tree
```

Just use the object indices as indexes into that tree:

```
x_position_of_ok_button = Tree[OKBUT].ob_x;
```

Some form of Unix I'd guess (Ultrix?). A vt200 series (vt220=
character terminal/vt240=graphics terminal-color even) terminal is
very useful for a real OS such as VMS :-).

>What am I missing with VT200? I don't need Latin characters to be displayed
>on my screen (couldn't read 'em if they did show up). In other words, what
>kinds of uses are there for VT200 that aren't covered by VT100?
> Just wondering,
> Kenneth Love
Wonder no longer... :-).

A vt220 terminal has many more keys that can be defined for multitudes
of things. I do some development work for a multiuser program that
uses ALL of the keys on a vt220. It is much easier for me to remember
the vt220 key sequences than the vt100 keys.

Also, there's the question of familiarity. Wouldn't you rather have
one type of keyboard ?? How many people actually USE a vt100 key board
? Why should I be limited to a keyboard from the dark ages (sort of
reminds me of those cheesie Mac keyboards without the function keys) ?

The real issue (I've said this before but it must not have made to the
outside world) is "What do we really want ??!!!!" As far as features a
vt102 compatible "terminal" mode should be the minimum for any
terminal program. For a KEYBOARD, I wouldn't want anything less than a
vt220...

Toad Computers @ (410)544-6943 or (800)448-8623 is very realiable and
their prices are reasonable. I have ordered both hardware and software
from them and was very impressed with the shipping time.

E.Arthur Brown also has some good prices on software and very good shipping
turn around time. They are at (612)762-8847 or (800)322-4405.

Both request use of 800 number for order only. At least give them a call
and ask for their catalog.

Pre TOS 1.4 versions could not handle a hard drive partition greater
than 16 Meg
and thus the 21 Meg floptical would be too large a partition.

Howdy, all!

I have a small dilemma that I thought some kind soul out there might be able to help me solve. I want to upgrade my copy of Warp 9, v3.61, to the newest version. Unfortunately, I have several different references which seem to be quoting different prices for the upgrade. One says $15, another $20.

So I guess my question is, how much is the upgrade? Any help with this will be GREATLY appreciated.

You must be new. ;-) I still have a 1/2 dozen issues of Compute
ST kicking around. For it's day, it was one of the best ST mags around,
though pricy, but also one of the first to include a disk. No quite as
techy as STart was for it's first year, but a good magazine.
Unfortunately, I guess sales didn't warrant it's continued
publication.

The STe, and probably the Mega STe, have RF out ports. If that's not acceptable,
I believe that the STe can be fitted with an inexpensive Genlock device.

This should be in the FAQ, but the answer is put the msa file in a ramdisk. Of course if you have a DS disk drive, and a 700k msa file, your SOL, but then you could consider a ram upgrade.

In article <1992Nov17.122627.16049@crc.ac.uk> naffara@crc.ac.uk (Dr. N.A. Affara) writes:
>As I understand it, things like NVDI and Warp 9 replace parts of TOS which
>was written in C, with bits written in assembler, which is faster.
>
>Would it be possible to rewrite the whole of TOS in assembler, and would this
>make it faster than NVDI etc?

Since I spent several years working on Quick ST / Warp 9, here is my
extremely biased two cents worth:

There are several different issues here. One is C vs. assembler. The other is
the efficiency of the algorithms used by TOS.

What I did when I wrote Quick ST was to replace a large number of the text and
graphics routines in the BIOS, GEMDOS and VDI portions of TOS with my own very
fast assembly language code.

In the case of BIOS (the VT52 text functions), those were already written in
assembler, or at least the code didn't look like it was compiled. You can
easily spot compiled C code by looking at the VDI code, because it is of such
poor quality. So why were the routines in TOS slower than the ones Quick ST?

The problem with the VT52 routines wasn't that they were slow, but that
they did some stupid things, like each time you print a character, it also
redraws the cursor which can almost double the time it takes to print a
character to the screen. If your program is using the Cconws() function in
GEMDOS to print an entire string of characters to the screen, what do you
think that TOS does? It does the slowest thing possible: it sits in a loop,
fetches a character from the string and does a TRAP #13 call to the BIOS
to print the one character. BIOS prints the character, redraws the cursor,
and returns to GEMDOS. Then it does all this again for the next character.

This is stupid code. What Quick ST / Warp 9 does is draw all the characters
at once in a very tight loop, then just draws the cursor once. This eliminates
much of the overhead of repeated TRAP #13 calls and eliminates a lot of
redundant cursor redraws. It is no wonder that you can get Quick ST giving
you 1200% to 2000% speed increases in the speed of VT52 text. Gemulator
uses the same trick to speed up the VT52 output speed by making such a patch
directly in the TOS ROMs (because in an emulator, you can! <grin>)

Another example of inefficiency is in VDI. VDI has about 100 graphics
operations, such as line drawing, rectangles, circles, text, setting colors,
setting clipping regions, etc. When a dialog box is being drawn, only a
handful of operations eat up most of the CPU time - text drawing using v_gtext,
rectangle fills (for buttons, scroll bars, window title bars, etc) using
v_rectfl, and v_pline (for drawing outlines, zoom boxes, etc). But about 30%

of the CPU time is eaten up in little helper functions, like setting the color of text, setting the clipping region, setting the fill pattern etc. These are very simple operations and should be very fast, but TOS's TRAP #2 handler which dispatches the VDI operations has an incredible amount of overhead, hundreds of instructions in fact, just to do ANY operation. By comparison, on the Mac you simply write a value through a pointer to accomplish the same thing.

By checking for these helper functions and handling them very quickly in Quick ST / Warp 9, I was able to get about a 20% speed up in GEM operations without even touching the big 3 (text, lines, rectangles)!

Now, the second issue is C vs. assembler. Most of GEM (AES and VDI) is written in C. Unfortunately, Atari seems to be using a really brain dead compiler that generated the worst possible compiled code you could imagine. It uses 32-bit addresses where 16-bit addresses will work, it doesn't use MOVEQ when it could, it copies variables to other variables then copies them back (which is redundant), and it doesn't actually seem to do much register optimizing at all.

So when I rewrote the major VDI calls like v_gtext, v_pline, v_rectfl, etc in assembler, all I did was use similar algorithms as what TOS used, but used registers instead of memory locations and other things that a smart C compiler could have easily done. The result of simply writing efficient is a 2 or 3 times speed increase. Anyone who's ever played around with optimizing C compilers on the PC like Watcom or MS C knows that there is a huge difference in the quality of code produced when you compile with /Ox or with /Od optiomization options.

Looking at code that is generated by newer compilers like Laser C and Turbo C, and comparing it against the brain dead code of Alcyon C that I believe that Atari used to compile the TOS ROMs, I am convinced that a simple recompile of the TOS ROMs would easily bring the size of TOS down to below 192K again, and at the same time double the speed of most TOS operations. Easily.

Remember in 1985 when TOS 1.0 was released on floppy disk it was about 210K in size. To get it down to 192K, what did Atari do - use a better compiler? NOT! They came up with this line F mechanism that shrinks the code but at the same time slows it down about 20%. They also used that as an excuse for not implementing the full font functionality of the PC version of GEM, so instead they came out with the hack GDOS which slowed down the system even more.

So in my opinion, trying to rewrite all of TOS in assembler would be a bigger waste of time than simply having Atari recompile TOS using an optimizing 68000 compiler instead of relying on a 1985 compiler. Sure, the hand coded assembly language version might be a little smaller and a little faster, but you'd be surprised at what a good C compiler could do.

My two cents worth.

5631. Re: Technical wordprocessors for ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 04:03:18 UTC
From: warwick@cs.uq.oz.au
Message-ID: <11108@uqcspe.cs.uq.oz.au>
Source record: 214634

madmal@spd.eee.strathclyde.ac.uk (Malachy Devlin - SPD) writes:

>Can anyone recommend a good technical word processor for the ST. ie. one that
>would allow me to enter (large messy) equations (easily)? and also have the
>ability to generate table of contents, tables etc or am I asking to much?

You're not asking too much at all! The program you've described is LaTeX.

If your serious about it, you should learn to use LaTeX for technical
word processing. It is available for every machine I can think of,
including Unix, Mac, IBM [all?], Atari ST[e]/TT/Falcon, and Amiga.

And, it's free.

You simply use a regular text editor (or a wordprocessor, if you want, but
they are generally much less powerful that text editors), then feed the
document to LaTeX, which produces PUBLICATION QUALITY documents as output,
which can be either sent to the screen or to a printer, or taken to a
publisher for making into a book even!

LaTeX is very simple. For example, this is a complete LaTeX document:

```
----------------------------------------

\documentstyle{article}

\begin{document}

Here is the Pythagorean Theorem:
\begin{math}
a^2 + b^2 = c^2
\end{math}

Written another way, this is:
\begin{math}
\sqrt{a^2 + b^2} = c
\end{math}

\end{document}

----------------------------------------
```

Which produces (approximately - my ASCII drawing skills aren't too good!)

```
----------------------------------------

Here is the Pythagorean Theorem:
```

```
2 2 2
a + b = c
```

Written another way, this is:

```
________
/ 2 2 2
V a + b = c

----------------------------------------
```

The basic skeleton is

```
\documentstyle{article}
\begin{document}
...
\end{document}
```

Which means you want the document to be an article (rather than, say, a report or a book) - which tells LaTeX to use certain traditional settings for margins, title layout, etc.

Above, were I've used:

```
\begin{math}
...
\end{math}
```

I could have just used \(... \) as a shorthand. This causes LaTeX to use special mathematical symbols and layout. Notice how easily the square root was given? A more "complex" example is:

```
\begin{math}
x = \frac{ y+\frac{z}{z+2} }{ y^2+1 }
\end{math}
```

Which produces

```
z
y + ---
z+2
x = -------
2
y + 1
```

(Except of course, it uses real graphically positioned, high quality scaled fonts (the "z/z+2", and superscripts are printed smaller), not dumb-terminal ASCII!!!!)

Once you start using LaTeX, everything else seems SOOOO weak!

Also, since LaTeX is used on millions of computers around the world, all kinds of "style files" are available for it. For example, if you want to have the document formatted in two-columns per page, simply change the document style line to read:

\documentstyle[twocolumn]{article}

Other features of LaTeX include:

Table of Contents
Sectioning (and subsectioning, and subsubsectong, etc...)
Index generation
Graphics
Figures
Tables
Greek & other mathematical symbols
Bibliography and Citations
Quotations
Poetry
Lists

There are drivers for all sorts of screen resolutions, and printers,
and support for Atari-specific things like .IMG image files.

The only thing is, I doubt whether LaTeX can be set-up on a floppy
drive system (ie. you need a hard drive). But then again, the
word processors on IBM PCs certainly need a harddrive to operate!!!

>(I suppose I would be looking for something like word for windows 2 for the PC)
>(apoloyises for mentioning PC in this group :-))

Well, if you've got at least 10 Mb of disk space available, there's a working version of TeX called CS-TeX4 on atari.archive.umich.edu, and some general intros to TeX itself. It works fine on my 1040 ST, using a DeskJet printer. Be sure to use the shell, and the English (as opposed to German) version.

TeX is widely used, and is especially popular with physicists and mathmeticians. The American Mathematical Society has contributed a set of fonts (ams); many fonts, macros, etc. are available through the net, as well as ftp-anonymous distributions of the source. TeX is a typesetting language, so there is a bit of a learning curve; it's probably best learned from someone else.

Well, I also understand there's a version of Word Perfect for the ST line, but I can't vouch for it. At a more primitive level, I think ST Writer may allow half-line moves and the output of printer codes, so you can access symbol fonts and other tricks, if you know your printer real well. But it's hard to beat the quality of TeX output.

I don't know about his dealings but this is not the first time I see users complaining about his service. The first time, he said due to lack of disks in the country (because of OS/2 and Windows) he couldn't get any disks and therefore was not able to send it. I believe the average waiting period for his product was 3 months.

Whatever the case, it will bring negative feedback from users such as the above.

Best Regards,
Mark K.

Yeah, I have seen this problem too and would be interested in finding out what the solution is.

Yes, the NTSC composite video comes out at the video port (at least on my
STe). It's on pin 2 (pin out shown below):

Monitor Connector
(Back of ST)
4 3 2 1

8 7 6 5

12 11 10 9

13

Don't even think about getting Silent Service 2 unless you have at least
1meg, and a Hard-drive. it's unplayable from floppy!

>intros to TeX itself. It works fine on my 1040 ST, using a DeskJet printer.
>Be sure to use the shell, and the English (as opposed to German) version.

I STRONGLY agree with this choice. CS-TeX is a superb implementation of TeX for the Atari. Typical users will probably want to use the set of LaTeX macros that are included that make it easier to describe documents.

LaTeX does a very nice table of contents; when combined with the (included with CS-TeX) BibTeX program, it has a virtually unrivaled bibliography referencing system. (Unix Refer which links to troff being the one possible competitor.)

It does gory math very well, and if LaTeX doesn't do it the way you want it to, (something that happened to me a few times in the production of my soon-to-be-completed thesis) you can drop down to the "nuts and bolts" TeX level.

Tables? Does 'em quite well. Some of what you type in looks like gibberish, but it sure looks good on the page. And it's mostly a fairly simple set of rules for tables.

>Well, I also understand there's a version of Word Perfect for the ST
>line, but I can't vouch for it.

It wasn't until WP version 5.1 that they had "real math." It's important to note that 5.1 has never been released for the Atari. I think the "latest" Atari version is the somewhat orphaned 4.2.

By the way, Word Perfect pays the highest compliment possible to TeX - the "equation environment" that they use to draw up mathematical

equations uses commands that are uncannily similar to those in TeX.
(Am I glad it's my office-mate doing equations in WP; I don't think
I'd have the patience for it...)

At the risk of mentioning the P* word, there are good PD
implementations for TeX and LaTeX on virtually any modern personal
computer.
Notables:

Atari: CS-TeX
Amiga: PasTeX
I*M: emTeX
M*c: ozTeX (?)

It's quite readily available in source form, and runs remarkably well
on almost anything that is associated with a variant of UNIX. There
are also versions for VM/CMS and VMS, but I'd rather not talk about
them.

For more information, hang around Comp.text.tex. The FAQ list is
periodically posted, and may even be longer than the Comp.sys.atari.st
FAQ. Which means that it's extensive, and well written, of course
:-).

Monday Night Real Time Conference
Host - Lou Rocha

LIVE from COMDEX
with
Sam Tramiel
President, Atari Corporation

Nov. 16, 1992

<[Lou] ST.LOU> It gives me great pleasure to welcome Sam Tramiel,
President of Atari Corporation, to the ST Round Table Monday Night
Real Time Conference. Many thanks to Sam for taking this time to
join us on the very first night of COMDEX '92 as Atari proudly
unveils its products at the largest computer trade show in North
America.

Sam... please tell us your impressions of the first day of COMDEX.
What were the highlights for Atari Corporation? GA

<[Sam] STRAMIEL> The show once again is a PC show and we are one
of two unique offerings, the other being Apple. We really feel
that we have some really exciting hardware and software in the
Atari Falcon 030. The important thing is to market the machine
properly and we are now planning the advertising for Q1 of 1993.

<[Lou] ST.LOU> Thanks Sam. Our first question is from JCD at Mag
Software.

<[JCD] MAG.SOFTWARE> Hi Sam. Thanks for being here tonite. Sorry I
am missing COMDEX this year. Our 1st born baby boy came Nov. 8th.
Being a new dealer, I'd like to know when we will get dealer
prices on the Falcons? European dealers are already advertising
theirs.
```

<[Sam] STRAMIEL> Mazel Tov Jeff on your baby, the dealer prices are now available; please call Sunnyvale on Monday next week.

<[Lou] ST.LOU> Our next question is from John Cole at Lexicor

<[Lexicor] J.COLE18> Hello Sam, how do you feel a possible trade war between the US and the EC will affect Atari. How would a trade war affect US marketing plans and planned prouduction?

<[Sam] STRAMIEL> our questions are very interesting but I really have no control of the situation. I really think that Europe will back off on the agricultural issues. All of Europe is against France on this.

<[Lou] ST.LOU> Eric Goodman is next. Eric?

<[ERIC] E.GOODMAN1> There are rumors of a tower version of the Falcon being shown at Comdex. Are these just rumors? GA

<[Sam] STRAMIEL> There is no tower version at the show and I can't comment further.

<[Lou] ST.LOU> Thanks Eric. Next we have SAM RAPP.

<[Not Sam T.] SAM-RAPP> Sam, there have been questions on whether the Falcon memory sits on a 32 bit bus or a 16 bit bus. Could you clarify? Also, any design changes in the production models?

<[Sam] STRAMIEL> Unfortunately, Leonard and Richard Miller are not here and I am not able to answer your question.

<[Lou] ST.LOU> Sam... our next question is from James French.

<[James] J.FRENCH2> When will the Falcon be available in Canada, same as U.S.?

<[Sam] STRAMIEL> The availability in Canuck land is the same as for the US. ea Canada on being World Series Champions.

<[Lou] ST.LOU> Sam.... the million dollar question... when do you think the dealers will see their first store models?

<[Sam] STRAMIEL> Some dealers will get machines very, very soon and we will contine to roll out shipments from now on, but real volumes starting in Dec/Jan.

<[Lou] ST.LOU> Thanks Sam. That is good news. Next we have Keith and Bruce from Canada.

<[Bruce/Keith] B.KLASSEN> Hi Sam, Here is our shopping list: 1) Is FSM and Speedo compatible? 2) When will dealers get Multitos for TT's? 3) Are all TT monitors cancelled? 4) Future of the TT in a tower and/or 040? 5)UNIX? Thanks,

<[Sam] STRAMIEL> 1. FSM and Speedo are not compatible and I have been using Speedo and it is great, with lots of fonts from Bitstream.

2. MultiTos is just being released for the TT, i.e. very soon. Eric Smith, another fine Canadian, is now living in California and is finishing things off.

3. No. 4. We are planning on a 040 machine and we have no plans on expanding our unix involvement.

<[Lou] ST.LOU> Sam... Brian Harvey from Nova Scotia, Canada is next.

<[Brian] B.HARVE7> Sam, what is the future of the MEGA STE? Will a MEGA Falcon replace it or will the MEGA STE be selling for a few more years? GA

<[Sam] STRAMIEL> The Mega/Ste is still being sold today and the production will depend on the demand which I think will slack off when the Atari Falcon 030 starts shipping in volume.

<[Lou] ST.LOU> Sam... Jason Brunken is next.

Is Atari or any other company currently working on the 'Virtual' modem/fax/phonemail system for the Falcon. If I know that I can get this I most certainly will get a Falcon!

<[Sam] STRAMIEL> I don't know what a "virtual".... means, but there is a voice mail system and a great fax/modem system.

<[Lou] ST.LOU> Our next question is from Robb Albright. GA

<[Veg] R.ALBRIGHT7> Sam, can you give us a brief overview of apps being demoed there, and if there are any press features (TV) that we can keep our eyes open for.

<[Sam] STRAMIEL> There are around 40 titles being shown, a lot of sound stuff, i.e. D2D, a beta version of "Concierge" the new name for Sutra, a wild game from Jeff Minter of Llamasoft, and a interesting sewing machine that stitches on hats and teeshirts, and the new Kodak Photo CD which now runs on The Atari Falcon 030 and the TT030. The deal with Kodak was just signed on Friday last week. Calamus showed SL which can use Kodak Photo CD and HiSoft has True Colour software.

<[Lou] ST.LOU> Sam, J.BRUNKEN is willing to clarify that 'virtual' question...

By "virtual", I was refering to using the 56001 DSP to emulate these devices rather than paying the big bucks to buy the actual hardware. Are any companies seriously exploring the use of the DSP at this point?

<[Sam] STRAMIEL> That is being worked on and should be out by second quarter 93.

<[Lou] ST.LOU> Ted Patterson is next, Sam.

<[Ted] J.PATTERSON3> What has been the reaction of showgoers to the Falcon 030 and other assorted goodies? Any new business likely?

<[Sam] STRAMIEL> So far, the reaction has been very positive and Dealers and Distributors alike are showing interest.

<[Lou] ST.LOU> Sam... Eric Goodman has been VER patient. ;-)

<[ERIC] E.GOODMAN1> Might there be a Jaguar appearing at COMDEX? and if not what info can we get on a release date? GA

<[Sam] STRAMIEL> We just finished the first two developer conferences, one in Sunnyvale, the other in London on the Jaguar system. It's going to be an awesome entertainment machine and delivery will be 2nd half of 93.

<[Lou] ST.LOU> Rod Cobble is here.

Hi, I was wondering Atari's plans for distributing the Falcon? Dealers? any chain stores considered? Mail Order? What will the street prices be? I need IBM compatibility, Would love to do it with one machine, Any word on Emulators?

<[Sam] STRAMIEL> Wow, a lot of questions. :-) We are planning of course to have dealers and chain stores and Atari mail order. There is a company in Germany, Compo, that is going to show IBM emulation tomorrow at Comdex, they say, if not very soon. One megabyte machine SRP is US $799, a 4 megabyte unit is $999 and 4 megabyte with a 65 megabyte hard drive is US $1299.

<[Lou] ST.LOU> Folks... please use your time for only one question... there are ten people in the queue. Next we have Daryl Monge. GA

<[Daryl] D.MONGE> What customer do you see for the Falcon that is not already an Atari customer? (P.S. f.y.i I would like to buy a tower Falcon040 :-) GA

<[Sam] STRAMIEL> We are going after the mass market home user and hope that with software like voice mail for the home and other great apps we can attract new users. The machine really is FUN to use. The sound effects are incredible.

<[Lou] ST.LOU> Thanks... Now it's Bill Prang.

<[bill prang] B.PRANG> Sam, I have a bunch of Atari stock that was worth 6000 and is now worth 600. Do you think that the new products in line have a chance of boosting values, and is Atari still buying stock on the market?

<[Sam] STRAMIEL> Atari has an open plan to purchase stock back from the market and has done so in the last quarter. I of course cannot predict the stock market but we have "rightsized" and hopefully will be going forward in a profitable manner with the Atari Falcon 030.

<[Jim] J.NESS> Bill Prang touched on this already, but let me upload it anyway... Hi. I know this is a tough one to have to answer, but let's mow through it anyway. The stock market has not shown any excitement over the Falcon intro. The quarterly financial results continue to be scary, for anyone banking on the continued existance of your company. How can you convince these financial pros that they are wrong about your company, and that they should count on some real near-term growth? This question is as important to your customers, who want to see you around for awhile, as it to your investors, who simply would like to make some money.

<[Sam] STRAMIEL> We still have close to $50 million CASH in the bank and are now running at a break even or small profit. We are not working for Wall Street but to make money for our shareholders and only think long term.

<[Lou] ST.LOU> Thanks Sam for that very insightful answer. I hope it puts some of the naysayers to rest for a while. Next is Geoff Sloan.

<[Geoff] G.SLOAN> Sam, can you tell us any of the companies that will be coming back to Atari to produce for the Falcon?

<[Sam] STRAMIEL> It is not a question of companies coming back but of companies writing new and exciting software that takes advantage of the features of the Atari Falcon 030. For example, we are getting quite a few NeXT developers who are used to working with 56000 DSP's and of course we are causing a lot of excitement in the audio area with the DSP and Atari Falcon 030 features which is better than CD quality with 50 kHz sound.

<[Lou] ST.LOU> Mike Allen is next. Mike is one of our regulars ;-)

<[Curmudgeon] M.ALLEN14> When can we expect to see offical, regular Atari participation here in GEnie?

<[Sam] STRAMIEL> I am going to be accessing GEnie at home and will be more active on a regular basis. (Nathan is getting that in writing!) ;-)

<[Lou] ST.LOU> SAM on GEnie?.. mind-boggling ;-) Next we have Bruce and Keith again. Thanks for waiting fellas.

<[Bruce/Keith] B.KLASSEN> o Sam. What is the status and capability of the SACK 286/386/486 card to give us that dumb DOS compatibility we could to use get people in the door, how soon for Speedo; will the wp features of Concierge have all the features of Wordup and will the spreadsheet be as good or better than LDW? P.S. We still 'love' Atari 030's!!

<[Lou] ST.LOU> Sam... you can answer any ONE of those ;-)

<[Sam] STRAMIEL> SACK is from Compo and is being shown tomorrow as a 386 SX. Speedo is very soon, within, I would guess, 4-6 weeks.

Concierge is a completely different program than WordUp but it has an excellent word processor and the spreadsheet is EXCEL compatible rather than Lotus. We also love our Atari's. ;-) ga

<[Lou] ST.LOU> Next we have Robb Albright. GA Robb....

<[Robb] R.ALBRIGHT7> Sam, I think you must have missed the second half of my first question, so let me try again.

<[Robb] R.ALBRIGHT7> Have there been any TV Cameras havering around the Atari area, and could you leak who they might be if so, i.e. CNN Headline, NBC, PCTV, so we can get a visual of the excitement we are reading about.

<[Sam] STRAMIEL> We have not seen in any cameras in the building yet. Hopefully we will have some exposure. However, CNN just received their review unit for technology week.

<[Lou] ST.LOU> Ooops.... who's next? James Vogh!

<[James] J.VOGH> Since the Falcon is a home computer, what is the status of game software and what about video phone capability?

<[Sam] STRAMIEL> We, Atari, have contracted about a dozen games and they will be released over the next few months and there are a number of developers busy working away on some great games. I have seen demos in the US and in Europe, titles such as; Raiden, Road Riot H4WD, Cyber Assualt, Steel Talons and Eclipse has a great spaceship game. The special new joystick which works on the STe, Atari Falcon 030 and Jaguar will be shipping in February. It has three fire buttons and a 12 key numeric keypad.

<[Lou] ST.LOU> Bill Jones from Portland ME is next. Bill GA

<[Bill Jones] B.BILLJONES2> I'm a newly registered ST developer who'll buy the Falcon Dev Kit. I'm concerned about the the level of developer support for the Falcon. Will support differ with the Falcon? And will the kit be more than a box of unbound papers?

<[Sam] STRAMIEL> Wait, re: the Video Phone question. I have not seen it myself yet but I have been promised that this will be possible.

The developer kit is much more polished that the old Atari ST kit and I feel that we are devoting a lot of quality time and effort to developer support.

<[Lou] ST.LOU> Rod Martin from Network 23.... ON THE AIR!

<[Net 23] R.MARTIN22> Any signs of BIG NAME companies porting BIG NAME software to Atari (Microsoft Write, PageMaker, QuarkExpress). I think this could be one of the biggest draws to current computer owners not happy with the computers they have now.

<[Sam] STRAMIEL> As we build up volume, I am sure that some "big name" companies will port onto the system. I feel that some of the software now available is better than those big names and much more price competitive. We just signed up Eastman Kodak as a Developer. I think you'll agree that they are a pretty well known company.

<[Lou] ST.LOU> Sam... here is Kent Cavanaugh from Surrey BC in Canada.

<[Kent] K.CAVAGHAN2> Hi Sam. Many of my customers ask about repairs. While I generally recommend our two local dealers, I was wondering what was happening with the GE service contract that was to be in place already? GA

<[Sam] STRAMIEL> I am not involved in this but will check with the US folks.

<[Lou] ST.LOU> Thanks Sam... Robb Albright is back in the queue and there are no others waiting. Folks.... please /raise your hand now.

<[Robb] R.ALBRIGHT7> There have been rumours that MultiTOS is "Not quite ready". Give us the scoop. Will it be shipping with the dealer demo units, and when (approx. DATE please) might my dealer here in Portland, OR see his demo units.

<[Sam] STRAMIEL> ou are correct that MultiTos is not quite shipping but as I said ealier, Eric Smith is now in-house and is polishing off the product and will be shipping with the Atari Falcon 030.

<[Lou] ST.LOU> Wow..... ten hands just went up... hang on folks... OK... LIVE.... T. Wilson... Bruce and Keith... P.Blagay.

<[Dark.Oak.Sof] T.WILSON14> Is MultiTOS and Falcon info included with new delveloper kits or are they separate packages? I'm going to buy them soon and wanted to know.

<[Sam] STRAMIEL> I believe that it is all included in one kit but you can verify this for certain by sending email to Bill Rehbock B.REHBOCK. ga

<[Lou] ST.LOU> Bruce and Keith were next in line...

<[Bruce/Keith] B.KLASSEN> Will the PTC1426 monitor work properly with the Falcon? What about new SLM'S SCSI 600dpi? Thanks again Sam GA

<[Sam] STRAMIEL> At Comdex, we are using PTC1426 on a number of Atari Falcon 030 workstations and we have no immediate plans for an Atari branded 600 dpi printer.

<[Lou] ST.LOU> Paul Blagay is next Sam...

Hi Sam, I was wondering how compatible the Falcon will
be with pre-STE software?

<[Sam] STRAMIEL> We took great efforts to have the Atari Falcon
030 be very compatible with all Atari 68000 machine software and
we think we were quite successful.

<[Lou] ST.LOU> Sam... I know you haven't had dinner yet, right?
Can you handle two or three more questions?

<[Sam] STRAMIEL> That is correct and we are starving. ;-)

<[Lou] ST.LOU> OK we have James French and Bill Aein.

<[James] J.FRENCH2> Good day, eh from Edmonton. Will there be any
goodies available for dealers like promo pamphlets, etc.

<[Sam] STRAMIEL> We will support Dealers with all kinds of
marketing and merchandising materials.

<[Lou] ST.LOU> Bill Aein.

Will the street price for the Falcon be the same as
manfacturers retail?

<[Sam] STRAMIEL> Unlikely.

<[Lou] ST.LOU> Sam, could you tell us what promo literature is
being distributed at COMDEX? Will there be any left for user
groups, etc.? Any news about the International Software Catalog?

<[Sam] STRAMIEL> Atari is giving away new Atari Falcon 030
literature and many software companies have attractive new
literature such as Hi-Soft and DMC's Calamus. It is a good idea to
send some to our loyal user groups. I will talk to Mr. Brodie
about this and the new International Software Catalog is available
at, I think, $12.95 retail and I'd be happy to fill your order
with your VISA card #. Please call Sunnyvale and speak to Don
Thomas next week, in customer service. It is, in fact, $12.00. We
just checked.

<[Lou] ST.LOU> Just two more... please? And could you have someone
post the address for the catalog? On GEnie... of course. ;-) Bill
Prang then Mike Allen to close it up.

<[bill prang] B.PRANG> Will a 17 in multisync work on the Falcon,
and what is the approximate financial investment now required to
be a dealer? thanks for your attendance.

<[Sam] STRAMIEL> Atari Corp., 1196 Borregas Avenue, Sunnyvale, CA,
94089-1302 Att: Customer Service, Don Thomas.

<[Sam] STRAMIEL> es, the size of the monitor is not a factor and
the Dealer should be financially sound. The investment required
depends on the sales targets and marketplace being served.

<[Lou] ST.LOU> Mike Allen... take us home...

<[Curmudgeon] M.ALLEN14> I have heard the Atari purchased the source code to Word Up 3. I have thought that WU3 was a WP that had great potential that ALMOST had it right. Does Atari have any plans for the WU3 source code? (Will Falcon run on th Falcon?

<[Sam] STRAMIEL> Mike Fulton has helped a lot on the Concierge program and he has given a lot of his Word Up experience to it. There are no plans for Word Up at this time.

<[Lou] ST.LOU> No text block Sam. Just a tremendous thank you. I know we did not cover all the questions that were sent to you via GEnie but I would like to express my thanks on behalf of all Atarians for the time you took tonight. Best wishes. Any last thoughts?

<[Sam] STRAMIEL> Thanks for joining us tonight in Las Vegas. We all hope that we make money tonight at the tables. :-) Wish us luck! Goodnight.

<[Lou] ST.LOU> Thanks to all the folks who joined us. Don't forget the two upcoming RTC's here in the ST Round Table with Host Brian Harvey.

==========

Nov. 18th... Keith Gerdes from TraceTech to discuss DATA DIET 2.0 and DATA RESCUE.

5640. Gemterm V1.2 released

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 07:14:31 UTC
From: mfg@gmd.de
Message-ID: <mfg.722157271@gmd.de>
Source record: 214643

Hi,

I have just uploaded the new version (V1.2)of Gemterm ("gemtrm12.zoo") on artari.archiv.umich.edu. It contains serveral bug-fixes and a lot of functional enhancements. "gemtrm12.zoo" should replace "gemterm.zoo in the Mint directory.

What is new since Gemterm V1.0

- Gemterm now checks wether GDOS is loaded or not. V1.0 crashed if there was no GDOS.
- The font selector now knows about the number of fonts installed. This should correct a bug that disabled font selection in some cases.

What is new since Gemterm V1.1

- Gemterm now runs also as application.
- Gemterm now supports the TOSRUN pipe.
- A small TOS startup program that launches TTPs inside a new window is included.
- The current working directory is now also a parameter for a program that should be launched in a window.
- Gemterm now knows about the environment variables "GEMTERMINF", "GEMTERMTTY", "GEMTERMAPPL" and "GEMTERMWINS". "GEMTERMINF" sets the path and the filename of the configuration file. "GEMTERMTTY" selects the device that is connected to the tty window. "GEMTERMAPPL" denotes the main application that Gemterm wants to talk to via the VA protocol and "GEMTERMWINS" adjusts the maximum number of term window during startup.
- Gemterm reads the environment variables "SHELL" and "HOME" for its default configuration.
- Bug-reports should be much easier, if you recompile Gemterm with the -DDEBUG option in case of crashes. With this option Gemterm traces all its actions to stderr.
- A bug that hang GEM, when activating window-arrows with a very high frequentcy should be fixed. (No more additional WM_REDRAW message from Gemterm to itself, but instant redrawing.)

If you have any ideas, bugreports, ... , drop a mail to:

This TeX/LaTeX stuff seems like it could be fun to play with. Does anybody have a starter kit? I have access to the atari.archive (assuming there are no problems with the move). What files do I definitely need and what files would be helpful. I especially want to be able to math type equations (like the original poster).

Are there any help files or sample documents out there? Books?

Is it possible to print the resulting files on a 24-pin printer? I could get access to a laser here at school, but I'd prefer to print on my own.

adTHANKSvance,
Kenneth Love

I wouldn't expect this behaviour in modern ST machines but old ST's had
version 1.0 keyboard chips which do suffer from mouse drift.

>Well, you can stop worrying about your TT. It craps out on mine, too, even
>with the pmmu2 24-bit programme from a.a. Sounds like false advertising
>to me! :-(

That's weird... I'm sure my copy of 'Llamatron' works fine on my TT with
32-bit addressing on, with sound throught the monitor (you don't need to hook
up the sound jacks like another post mentioned). I don't do anything...
I double-click on it in TT Medium rez, with my normal setup... cache on,
no 24 bit addressing program, all ACC's and AUTO prog's up and running...

I'll check tonight whether I'm not hallucinating and it does work.

My version isn't any TT specific version either, it was either snaffled
from atari.archive or from ST Format (or perhaps ST User) magazine coverdisk.

I wonder does everybody who can't get Llamatron working have TOS 3.06 (I've
got 3.05)

Message-ID: <kNDHuB2w165w@midiline.la.ca.us>
Source record: 214661

I have an Atari MEGA ST2 (TOS 1.2), and it doesn't like working with my HP Deskjet 500C. Is there someone out there who can tell me how to create a printer driver in 1st Word (not 1st Word Plus!) to work with my HP Deskjet 500C? Also, it seems, after the first printout from the desktop I do on my Deskjet (you know, double clicking on a non-program file to get the [Show] [Print] [Cancel] dialog box), it won't do anything more. If I tryu another printout, it just sits there, like the printer isn't connected. But I know it is... What's wrong?

Detailed explainations, assistance, help, etc. much appeciated.

Reply in Email to: jared@midiline.la.ca.us

Thanks!

Jared

Geez, I remember the days when Compute! was a REAL computer magazine,
with type-in program listings, inlcluding Atari ST. Of course, when they
removed the type-in programs, I cancelled my subscription and got my
money back... (I learned a fair bit about ST programming from those
listings. I don't think I ever used one as they presented it, but it
taught me a lot...)

<sigh> The only magazine left that gives type-in listings is Dr.Dobbs.
Kinda sad, really. How are new computer owners supposed to learn how to
program now? (yes, I learned programming from Antic... that probably
explains a few things about my code...)

No, you don't. For a normal STE they might be slower (-100ns). But you can
buy these 70ns SIMMs. I think 80ns-100ns isn't much cheaper to get.
But you can also use 9-bit SIMMs. They are much cheaper then the 8 bit
version (the PC-Market causes that) !!

5653. Re: Accessing joystick from 'C'

I never saw it properly documented, so about 4 years ago, using information from the old Abacus/DataBecker internals book, I set about investigating the Keyboard vector routines, using a packet handler which I could patch into the vectors I wanted to investigate. The C program I used is given below. As written, it hooks into the status and joystick vectors. For just the joystick information, it is not necessary to use the status vector. Obviously, the program could be cut dow to just bare bones for joystick handling, but I thought the complete thing might be of interest.

It was compiled using Lattice C 3.0.4. UBYTE is just a typedef of unsigned char. You won't need <portab.h> if you define this by hand. cprintf() is just printf() directly to the console. The include file <fctype.h> is just a variant of <ctype.h>, which itself would do fine.

It should be compiled to a .TOS executable.

```
------------------------------------------------------------------------
#include <portab.h>
#include <osbind.h>
#include <fctype.h>

typedef struct {
void (*midivec)();
void (*vkbderr)();
void (*vmiderr)();
void (*statvec)();
void (*mousevec)();
void (*clockvec)();
void (*joyvec)();
void (*midisys)();
void (*ikbdsys)();
} KBVEC;

UBYTE joy0,joy1;
UBYTE list[10];
int got=FALSE;
```

```
void dopkt(packet)
UBYTE packet[];
{
register int i;

for(i=0;i<10;i++)
list[i]=packet[i];
got=TRUE;

if (packet[0]>=0xFE) {
joy0=packet[1];
joy1=packet[2];
}
}

void main()
{
KBVEC *p,save;
UBYTE old0,old1;
char buf[128];
int cmd;
char c;

p = (KBVEC *)Kbdvbase();
save.joyvec = p->joyvec;
p->joyvec = dopkt;
save.statvec = p->statvec;
p->statvec = dopkt;

Ikbdws(0,"\x12"); /* Turn mouse off */

old0=old1=0xFF;
cmd = 0;

for(;;) {

if (Cconis()) {
c=toupper((short)Crawcin());
if (c=='\x03') {
Ikbdws(0,"\x08"); /* Restore mouse operation */
p->joyvec = save.joyvec;
p->statvec = save.statvec;
Pterm0();
}
else if (c=='\r') {
buf[0]=cmd;
Ikbdws(0,buf);
cmd = 0;
}
else if (c>='0' && c<='9') {
cmd = ((cmd & 0xF) << 4) | (c-'0');
cprintf("cmd = %X\r\n",cmd);
}
else if (c>='A' && c<='F') {
```

```
cmd = ((cmd & 0xF) << 4) | (c-'A'+10);
cprintf("cmd = %X\r\n",cmd);
}
}

if (got) {
cprintf("Packet = %02X %02X %02X %02X %02X %02X %02X %02X %02X %02X\r\n",
list[0],list[1],list[2],list[3],list[4],
list[5],list[6],list[7],list[8],list[9]);
got=FALSE;
}

if (old0 != joy0) {
old0 = joy0;
cprintf("Joy0 = %02X\r\n",old0);
}

if (old1 != joy1) {
old1 = joy1;
cprintf("Joy1 = %02X\r\n",old1);
}
}
}
```

Armed with the information gleaned by this program, it was possible to write assembler routines to setup, use and unsetup the joystick. JOYINI and JOYEND should be callable from ASM or C, and the global variables JOY0 and JOY1 will be updated automatically whenever a joystick state changes.

I can't remember what bit means what, but that is easily determined by trial and error.

```
;
JOYINI MOVEM.L A0-A1/D0,-(SP) ; Save registers
MOVE.W #34,-(SP) ; Kbdvbase()
TRAP #14 ; Xbios
LEA 2(SP),SP ; Better than ADDQ, as it
; doesn't set any flags.
; Now D0 points to the table of longword vectors. The
; joystick vector is at offset 24 from this.
;
MOVEA.L D0,A0 ; Must be in an addr reg
MOVE.L A0,ADRSAV ; Save table address
MOVE.L 24(A0),JOYSAV ; Save current joy value
LEA OURJOY(PC),A1 ; Position independent
MOVE.L A1,24(A0) ; Point vector to our code
PEA MOUSOF(PC) ; Command to turn off mouse
MOVE.W #MOUSOFL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
```

```
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
MOVEM.L (SP)+,A0-A1/D0 ; Restore registers
RTS
;
JOYEND MOVEM.L A0,-(SP) ; Save registers
MOVEA.L ADRSAV,A0 ; Point to table
MOVE.L JOYSAV,24(A0) ; Restore old value
PEA MOUSON(PC) ; Command to restore mouse
MOVE.W #MOUSONL-1,-(SP) ; Length-1
MOVE.W #25,-(SP) ; Ikbdws()
TRAP #14 ; Xbios
LEA 8(SP),SP ; Tidy stack
MOVEM.L (SP)+,A0 ; Restore registers
RTS
;
MOUSOF DC.B $12
MOUSOFL EQU *-MOUSOF
MOUSON DC.B $08
MOUSONL EQU *-MOUSON
;
; This next is our joystick interrupt routine. We may use
; registers A0-A2 and D0-D2 without having to save them.
;
OURJOY MOVEA.L 4(SP),A0 ; Pointer to packet
CMPI.B #$FE,(A0) ; Joystick packet?
BLO.S NOJOY ; Ignore if not
YESJOY MOVE.B 1(A0),JOY0 ; Copy joystick 0.
MOVE.B 2(A0),JOY1 ; Copy joystick 1.
NOJOY RTS
;

5654. 21 meg floptical info

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 13:46:44 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <19NOV92.08464456@cc4.crl.aecl.ca>
Source record: 214660

MANY netters have asked me for info about the floptical. It is too time consuming to send individual replies so here is a general post:

To use a floptical, you need one of the following configurations:

TT with SCSI port -- SCSI cable -- floptical (cable comes with floptical)

ST/STE with DMA port -- LINK DMA to SCSI adapter on SCSI cable -- floptical

The only difference is that ST/STE systems do not have SCSI ports so you have to add the LINK DMA to SCSI adapter onto the end of the SCSI cable.

Run the ICD boot program that comes with the LINK adapter and voila, you can access the floptical (your computer sees this as another hard disk so you will have to install another desk icon).

It's that simple. It's all available from TOAD (I sell to the CDN market but I do not post my company's name on the net to avoid commercial conflict)

BTW, the floptical R/W 1.44 and 720 disks; currently no way to format them on the floptical because these formats are used for floppies and the floptical is treated as a hard disk. Sounds like a quick job for the Codeheads!!!

5655. Re: help with (de-)archivers please

From: wmtwen@rw8.urc.tue.nl
Message-ID: <wmtwen.722185578@rw8.urc.tue.nl>
Source record: 214211

for .arc files you need arc.ttp (preferably version 6.02)
for .zoo files you need zoo.ttp (preferably version 2.01)
for .lzh files you need lharc.ttp (preferably version 2.01i or higher)
for .zip files you need stzip (version 2.0 at the moment I think.)
and then there are .arj files which are not used very much on atari
computers and .msa files which compress entire disks (no fun)
for .Z files you need compress.ttp or uncompress.ttp (compress -d will
work too) (you should get a 16-bit verions of compress to uncompress
most .Z archives.)

Erlend.

5657. Exchangable Harddisk: How well does they work?

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 15:21:57 UTC
From: cpr@dde.dk
Message-ID: <1992Nov19.152157.24803@dde.dk>
Source record: 214674

I am considering buying a harddisk with removable media, but I no idea how well they work, and which one to use (so far I have seen an advert for a SyQuest 44M drive).

It must be able to work with my AdSCSI Plus controller and harddisk (Seagate something). I am looking for a way of getting a larger disk capacity and a convenient way of making backups (just lost the entire disk contents by means of DLII and Reorg the other night).

thanks - also for any hints towards any good disc-recovering tools :-(

> Ivica Rogina, rogina@ira.uka.de

Hi! As I don't know if you recieved my local message I am posting this
in the news. I have been using the monst disassembler for some time
now and it's really the best i've found in Public Domain. It won't let
you load a code-data file as if it were .prg, .tos, ... but you can load
the data to a certain memory address and then redirect the PC to it or
just look at it with "m [address]". Of course you have to take care that
you don't overwrite some important data in memory, therefore you should
load it to a high address... the screen buffer (normally $78000 or $f8000
depending on 1040 or 520) would be a possible option if your code doesn't
work with this zone of memory.
If what you want to do is some serious assembling with your ST and you
don't mind giving away some coins then I would recommend you (how not...)
GENST/MONST2 wich has some very usefull improvements over the first.

I believe it to be $20. I upgraded my original Warp 9 disk at WAACE and it
was $30! This is because of the major updates includingthe new selectable
screen saver option, known as Extendo-Save. It is very much like After Dark
for the PC/Mac. But it is really worth the upgrade. But for an absolute
answer, call codehead!

5662. MGIF 4.0 problem (was Re: MGIF 4.0 uploaded to atari.archive)

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 16:54:20 UTC
From: ehs@jyu.fi
Message-ID: <1992Nov19.165420.23954@jyu.fi>
Source record: 214664

In article <1992Nov18.110007.11018@jyu.fi> I wrote:

>Also, anybody else having problems launching this version under
>tcsh? It works just fine until it says "copy to transform array"
>at which point it just exits.
(and so on...)
To clarify things, further experiments have revealed that
this seems to happen whenever there's less than some 2.5 meg
free RAM available. So it was not a tcsh bug/incompatibility,
only this mgif version being quite the memory hog.

5663. Help! TOS 2.06 requires jumpers set...I have resistors.

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 16:55:42 UTC
From: morrison@ee.ualberta.ca
Message-ID: <morrison.722192142@ee.ualberta.ca>
Source record: 214666

Greetings,

I just recieved the TOS 2.06 ROMs I ordered a couple of weeks ago from CodeHead. The package is really slick. I popped out my old ROMs, put in the new ones, and then hit the section about "jumper" settings. I hunted around for about five minutes, looking for the "jumpers" W102, W103, and W104 without finding them. Then I started looking closer at the system board, at the printing, instead of just looking for jumpers. Aha! There they are...right beside the ROMs...only they aren't jumpers, they're resistors, soldered right into the board.... So, I said, "S#*t." And that's where I'm at still.

So, what do I do? Continue using TOS 1.4? Desolder the resistors from the system board and resolder them in the correct positions? I am hesitant to apply a soldering iron to my system board. Could I install jumpers of my own, or are these resistors critical? (I can't tell what value they are as they have been painted over.) This makes me quite angry.

Oh, yes, I should mention that the "jumpers" are soldered into the wrong points for the new ROMs, according to the docs CodeHead sent me, and I tend to believe the docs...my system won't come up when I power it on.

Can anyone give me some advice? What do these jumpers do? Are they involved in addressing the new ROMs? Help!

csullogg@cc4.crl.aecl.ca stated that ...
>BTW, the floptical R/W 1.44 and 720 disks; currently no way to format them
>on the floptical ...

I have formated both types of floppies on my floptical, _no_problem_.
True, you must use ICD's ICDFORMAT.PRG to do it, but the floppy is correctly identified as a 720 Kbyte or 1.44 Mbyte hard disk (probably looks at the holes in the top of the diskette to determine what type of disk it is).
After formating, the program asks how to partition the new hard drive. I get a kick out of _that_ one. I suppose you could partition a 720 as two 360's but I haven't tried it.
I routinely format 720's in the floptical, make a single partion, and then move the floppy to the internal DS/DD floppy on my STe and R/W files.
Single sided disks, 10 sector disks, and 80+ track disks are bad news to the floptical, however.
BTW, I bought my floptical from Joppa computers. I believe they sell the floptical for 400 dollars and the floptical with LINK for 500, but please check with them for current pricing.
Thanks for reading,

> Questions :
> Does anyone have any info on Cumana OS/9 ?

I don't know about Cumana, but I do about OS/9.

I'm going to assume that the OS/9 you're talking about is the same OS/9 I know about. I doubt there are two. OS/9 has been marketed by Microware Systems in Iowa (or was it Idaho?) for over a decade. It started as a assembly-written multitasking mini-unix system for the Motorola 6809 chip (8bit external/16bit internal). That was first used as a controller executive system (real-time system), and then a whole set of business applications were developed and sold as S100-bus systems (remember them? - or am I showing my age?). It was top-of-the line micros at that time. Eventually stupid Tandy picked up OS/9 as the OS for their Color Computer after years of hackers yelling at them to do so. Then came the high-end systems translation to 68000 machines - and you can now get it (I assume Microware is still afloat) for probably over 100 machines, mostly 680X0 - including the AtariST.

It comes basically as a full-blown Unix system with the command names slightly changed to protect the innocent. The difference from 4.3bsd, or SysV is (1) size is very small, (2) modular OS - add whatever drivers you like for your system - even while the OS is running (3) it's REALLY a real-time system as opposed to Unix hacks to mimic one.

It has been a few years since I've had any contact with it, so all this is retrospective.

> 1) does it multitask ?

yes. Essentially same way as Unix, except it can be a real-time sytem as well as general time-sharing.

> 2) does it have specific applications ?

It has a very large set of applications, as it has been used for many years as (1) office/accounting systems and (2) real-time controller and (3) Unix-type development systems. The applications are basically everything you have that can be legally translated from Unix systems, plus a few hundred third-party applications - not the well-known ones, though, like Microsoft, Ashton-tate, whatever.

> 3) Can it recognise a network ?

Yeah, network capabilities.

> 4) What is it !!!!!?????!!

> 5) WHat are os/9 's capabilities ?

See above.

Really? You mean you simply cannot format 720K or 1.44Mb floppies on a
floptical disk drive? Hmmm, that certainly sheds another light on the
subject of the true usability of a floptical!

>Do you HAVE to use ICD's LINK to connect a floptical? I have an ICD host
>adaptor for my external SCSI hard disk. Can I not plug a floptical into the
>DMA out plug on the external disk?

The story that I hear locally is:

Yes, it works with the other ICD Host Adaptors.

But you need the newest version of the software (something like
ICDBoot 6.0.4). There was someone that picked up one of these units,
and was trying to run it using version 6.0.2, without success. It's
probably a good excuse to send ICD five bucks to upgrade you to the
latest edition.

There may also be problems formatting flopticals using a version of
ICDFORMAT.PRG older than the latest edition.

I suggest you wait 2 weeks until the versions stabilize before buying
:-). It probably won't take as long as Falcon, since the hardware and
software are both quite readily available, but may just need some
coordination. And ICD seems to be a little more coordinated than
Atari...

>Though, I heard that there weren't any new systems announced.

I was there Monday and Tuesday, it was a pretty good show. Sorry I didn't take many notes. The Atari booth is in the Sands conference center, they have the largest booth there. (I guess the Sands facility is 2nd or 3rd compared to the main exhibits in the Las Vegas Convention Center...) Plenty of Falcons there, all running TOS 4.01 in ROM. No new systems were announced while I was there. There was a corner showing music applications, with a good MIDI setup and various other stuff, the main emphasis seemed to be on the D2D direct-to-disk digital recorder. Hisoft was there in the applications corner showing off their product line on a pair of TTs. There were a couple other companies whose names I don't recall right this moment, showing some word processing and other stuff. One Falcon was setup with a JRI Genlock box and a video camera, scrolling graphics text over a live view of the passersby. The Kodak PhotoCD system was being demoed as well, showing PhotoCD images in 768x512 resolution on an SC1224 equivalent as well as a larger (20" or so?) TV. There was another kiosk for graphics apps, which I didn't spend too much time at. At the productivity booth they were showing a Falcon-controlled loom/weaving machine or whatever you call it. It was pretty slick, the guy had a scanner to scan in an image, and then with the control program you could do stitch-pattern fills on regions of the image, and then the machine would go and weave the image on your target form. This machine was setup with baseball caps, doing multi-color Atari logos and other such.

My company [Digital-Optical-Analog] is showing our voice-mail system at the telecommunications kiosk, which is a single-line multi-user voice-mail/ automated-response system for the Falcon. After a bit of discussion it looks like we will start work on a multi-line unit as well, but the single-line system is operating nicely at the show. On the other side, there was an STFax setup as well as some other terminal program and such. At another corner there was a large screen TV showing a true-color video and live audio demo, and at the opposite corner they had their Targa slideshow program running on another TV. Last but not least, there was a kiosk with a couple Falcons running various game demos, and a bunch of portfolios on the opposite side.

John Nagy and John Tarpinian from AtariUser were there Monday, so you can expect a more detailed report from them in the next issue.

There was another company that was supposed to be showing a text-to-speech system next to our setup, but their English version wasn't ready so they opted not to setup at all. Too bad, they said their French and German systems were quite good, and it probably would have been worthwhile to set that up regardless.

I managed to break away from our booth and get to the main convention hall for about an hour, that was somewhat interesting. I stopped in at the Motorola booth to try and get info on the 68060 but no info was available. They did have two Falcons on display as well as a Commodore Amiga 4000 and various Apple Quadras.

Monday was a pretty slow day, things were busier on Tuesday, and apparently Wednesday is the peak day for the show but I had to get back to my day job by then so I missed out. The booth is pretty well situated though, we had a lot of traffic coming by doing double-takes ("Voicemail on a PC?") and tripletakes ("voicemail on an Atari??") and a lot of folks were stopping to ask questions, and they all seemed suitably impressed by the voicemail system. (If I do say so myself...) Sam Tramiel brought a number of prospective distributors by our setup to show off the system, so I'm pretty optimistic about having drummed up some good business there. He also brought Jack by a couple times, which was rather a gratifying experience.

Other folks I can still identify by name... Bob Brodie (of course), J Patton, Bill Rehbock, Mike Fulton... hm. Art Pruszynski, who was head of the Atari Unix project and is now head of the US Marketing effort. I had quite a few excellent conversations with him, talking about what happened to the TT Unix project, some other stuff. Apparently the TT Unix was complete as a product, but they felt that its performance was too lackluster to justify marketing it (and the cost of support that would entail). It seems to me that another company could easily approach Atari about buying the rights to the product and distributing it themselves, if you're really set on seeing it appear on the TT. I was tempted to volunteer our company right on the spot but I don't think we have the manpower at the moment nor is it really in the company's focus. (Oh well.) At any rate, the development effort there isn't going to go completely wasted, they'll revive the project when they have a fast enough system to run it on. I'd expect to hear more rumblings about a 68040 machine by early next year, but definitely nothing by the end of '92.

Kind of a jumbled report, but I think you get the idea. (Mebbe the jumbled recollection is a result of my slightly questionable mental state at the time, I'd been up 4 days straight getting our demo together...)

This is a long-standing bug, there is no fix since there haven't been any
new releases of Gulam since 1987. Just don't use the mem command.

I've been using a Syquest 44MB drive for 2 years, it works fine with ICD
AdSCSI. Just plug it in and partition it, nothing to it. Btw, if anyone would
like to buy my 44MB drive (so I can buy an 88MB unit, heh) drop me a line.

>only this mgif version being quite the memory hog.
>
>EeroS

The problem is that MGIF allocates too much memory for the image buffers. Only
32k remains if you have less than 2Mb free when you start.
The 96k needed for the flicker screens is not allocated until after the
unpacking and the program does an exit(-1) if the allocation fails.

Below you'll find a small uuencoded program that will patch MGIF if you run it
in the directory where you keep MGIF.TTP. It does exactly the same thing as the
source code change described.
With this fix it should be possible to run MGIF even on a 520.

By the way, I'm working on v4.1 now. I've already added a quick preview using
ordered dither (a little over a second for a full screen).
Please, let me now what you'd like to see in MGIF.
JPEG? Medium res? More image processing? GIF writing?
If you think you could help, please mail.

------
If you have the sources and can compile them:

The following line is what causes the problem(at the start of main() in mgif.c)

MAXIMG = MAXRAW = ((long)Malloc(-1L) - 32768) / 2;
^^^^^
This is the amount of memory left in the system after allocation of the image
buffers. Try changing this to 131072 (=128k) for example.
This will solve the problem.

----- cut here ----

5680. more 21 meg info

Newsgroup: comp.sys.atari.st
Date: 1992-11-19 21:34:13 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <19NOV92.16341313@cc4.crl.aecl.ca>
Source record: 214685

I keep getting requests for info on the 21 meg floptical I bought. I cannot take the time to answer reach netter individually so here goes - again.

First, a net wide apology to everyone for writing LYNX instead of LINK in my original posting. Just found out that I made the error. Maybe that's because I own a LYNX and the LINK.

Second, the floptical I have, purchased at dealer pricing from Pacific Software in California (I am a dealer) is a SCSI device that plugs into any computer with a SCSI port (like the Atari TT). If you have an ST or an STE with a DMA, not a SCSI port, you have to by the LINK adaptor from ICD - this little device converts your DMA port (the hard disk port) into a SCSI port. If you already have an external drive on your ST/STE, just plug the LINK adaptor into the OUT port on the hard disk (assuming it has an IN/OUT like my FA.ST drive does) and then plug the floptical into the LINK.

You will need to run either the ICD version 6 boot program or an equivalent code that allows you to recognize a remmovable disk on your system.

The floptical is treated as a removable 21 meg hard disk. Let's say that you have a hard disk with partitions C,D and E and then you plug in the floptical an reboot. Drive F will be the floptical and you'll need to install a disk icon for F. Hard disk utilities can format the floptical, as far as I can tell, currently there is no provision to format 720K or 1.44 meg floppies on the floptical although right now you can read/write these disks of they are already formatted.

Last, sorry for all the typos. I am on my way home and I have typed this note at a w.p.m. rate far above what I should have.

>standard everything-else....
>
>And how much dollars to get to functional use?

Call Purple Mountain Computers at 206-747-1519 (the people who also carry Gemulator). The floptical package is about $400 I think.

What you get is the ICD LYNX (no not the game machine). It's a connector that plugs into your ST's DMA port to hook up SCSI devices such as the floptical drive. As far as your ST is concerned, the floptical is just another hard disk. You even get the ICD hard disk software with it.

You get 21 meg of storage on each diskette, and the drive does read and write 720K and 1.4 meg floppies as well, so the floptical does double as a 1.4 meg drive upgrade. The diskettes are about $20 each.

Claus, I've used a Syquest 44 with my Atari and Mac for over 4 years now with never a problem. At my work office, we use Syquests as primary storage devices for some of our machines so they are on all day, every day. There were reports of some problems with Syquests a long time ago, but I've never had a bit of trouble with them, and I bang the carts around mercilessly.

Highly recommended!

I agree with everything said about LaTeX, and suggest that you get CSTeX
from a.a. It is self-installing, so that even a dummy like me can set it up.
It runs easily from the GEM desktop, so you don't even need
Gulam/Mint/Okami/Mupfel.... And you can interface it to your favourite text
editor, and have other useful programs available instantly from the menu
bar. Great stuff!

I assume that you have a STe, and those resistors is on 1 ohm, so they
practically are (more or less) jumpers. Just unsolder them and move them to
the right position, and everything will work.

5694. GAWK .... and sed

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 01:16:20 UTC
From: Mike Stramba <stramba@zooid.guild.org>
Message-ID: <1992Nov20.011620.21168@zooid.guild.org>
Source record: 214466

I was looking for GAWK and this seems to be it (atari.archive)

Does anybody know what's in these files:

```
./Gnustuff/Tos/Gawk:
total 1192
-rw-rw-r-- 1 staff 140560 Nov 01 20:35 cawf2st.zoo
-rw-r--r-- 1 staff 16159 Nov 01 20:36 contents
-rw-rw-r-- 1 staff 175199 Nov 01 20:36 gawk213b.zoo
-rw-rw-r-- 1 staff 272825 Nov 01 20:36 gawk213s.zoo
```

I presume 213b is the binaries, 213s is the source ?

What else is in 213b besides just the awk program ? (tons of examples and a manual ... I hope??) that makes it 175K????

Mike

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1ehfs8INN6u3@golem.wcc.govt.nz>
Source record: 214700

Use 'Ultra-Pack'. It uses less RAM, gets MUCH better compression (better than Lh1). Is just as simple to use.

It will handle compressed files up to 800k if you compress/decompress them from an 800k RAM-Disk on a 1meg machine. The program itself uses only about 20k for buffers etc.

It's also about the same speed!

(The resulting files are also a lot smaller)

Ultra-Pack 1.1R is on atari.archive.umich.edu in the atari/Archivers/ directory!

(It was advertised before - but, as with all useful bits of information, no-one took any notice)

I'm writing my own FAQ, with USEFUL information in it. (e.g. this sort of thing, as well as MS-DOS/ST compatibility with disks etc. etc.)

>
>What about on a 4meg machine w/RAMDISK and NO hard-drive?
>
> -Matt

In theory it *should* work okay from a RAM-Disk!! (The program takes
up just under 1 1/2 meg, so no problem with memory!

(I don't have 4-meg, so I couldn't try it!)

I've actually Packed the .PRG files with 'PFX-Pack' and put all the files
onto one twister-format disk. Net result, faster loading of the .PRG files,
and all the others due to the twister format. and no disk-swapping. It's
still annoying to play, as it accesses the disk too much!

>missing some fundamental piece of information (or maybe we're supposed
>to bang our heads for a little while...).

Tut tut. In 30 minutes, I worked it out and solved the game. :-P

1. Pick a remaining key colour (see the column of keys?) (you don't need
to do anything, just pick one in your head).

2. Using only the two shapes of piece in the bottom right hand corner of
the board, cover all balls except of the colour of the key you chose.

3. Repeat until all keys used.

Alternatively:

Play breakout. :-).

Does anyone know if this break-out thing has any point? I played for
longer on the breakout than the key component, but got nowhere.

I have heard that a 16-bit bus attached to a 68030 is not as bad as
I'd first thought. The 16-bit bus does not NECESSARILY cripple the
architecture. I don't have the details, but apparently you can use
a 16bit bus and multiplex it for upper and lower 16 bits.

I'm only saying "may not". I'll try to recover the origins of my
info. I think it may have been with regard to the Apple LC.

I'm suprised that Bob Brodie, or whoever officially stated that the Falcon
had a 16-bit data bus did not give these details, however.

Remember that the Quickindex figures showed the Falcon to be approx 50%
of the speed of the TT for CPU-memory related tests (not 25%) - indicating
that the Falcon does not suffer a 50% loss in speed from the 16-bit bus,
or the TT is 16bit... or 16MHz :-).

5699. Reading file-date from GFA

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 02:02:57 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1ehh0hINN6v6@golem.wcc.govt.nz>
Source record: 214453

Okay, someone suggested for my little Time & date setter & saver program, that I store the time & date in the .PRG file's Time & Date-stamp. Doing this is easy, I just 'TOUCH' the file. Reading it back in however, it not as easy. How would I go about doing this??

I could call list of the directory with 'FILES' searching for the TDSS_1_2.PRG file, then storing the list in a string, then getting the time & date from the string, and setting it - but is there a simpler method (or, more accurately, a SHORTER method, as that way would increase the filesize by almost 1k - and something as simple as this program should not be too big!!)

Here's an idea. Forget it. Most games "break the rules" and are so dependent on
the system timing of an 8Mhz ST, that they just won't run in 16Mhz.

I love this ad. It's been around for years, and it gets my vote for "dumbest mistake in a magazine ad". The picture in the ad protrays a man sitting at a desk with an ST in front of him, and an electronic keyboard to his right. He appears to running some kind of sequencing program. Now, look at the picture. Look at the MIDI ports on the left side of the ST... WITH NOTHING PLUGGED INTO THEM!

How can they claim to know anything about the ST's use in music, and not even have the computer set up right in their ads?

You must be talking about Dungeon Master.

> Also, what happened to that company who made it? Did they ever
>make anything for IBM or Mac? Please I'd like ALL info. Thanks.

Well, FTL (the company that made it) released versions of Dungeon Master for a number of different computers, including the Amiga, the Apple IIgs, and IBM-compatibles. DM's sequel, Chaos Strikes Back is only available for the ST and the Amiga, as far as I know.

Oids, which is an Asteriods/Lunar Lander-type game was released for the Mac. Don't know if Dungeon Master was, though.

this is -really- strange. i was under the impression that all 68k
processors after the '020 were 32 bit all the way 'round. can someone
post a 'family tree' of the 68k series & what is what? going to
24/16 for a 32 bit processor sounds like something Intel would do,
not Motorola.

i realize that Motorola doesn't have a lot to do with the bus design,
but it seems to me that trying to fit a 32 bit external processor
on a 24/16 bus would be a lot more hairy than just making it 32 bits
in the first place.

> tell me what the 'working' name for the Amiga was? hint: Amiga was
> part of the name (I think Amiga might have been the name of the
> group/company who developed it)????

Amiga was the name of the company that made the Amiga computer. i
believe they were under contract to Atari to produce a video game
system. somewhere along the line Commodore bought them and it was
turned into a computer. Atari later sued & got a cash settlement.

i picked up an original Amiga joystick a few years ago at a garage
sale for $2. it's a tiny little black thing with a red stick that's
about the size of a big toggle switch. still works, even after logging
hundreds of hours on Silkworm IV. best joystick i've ever owned &
considering the way it's designed i don't expect to have to replace
it anytime in the next 10 years. (unless i get a Falcon with those
funky new keypad things.)

Date: 1992-11-20 02:43:36 UTC
From: jsteiner@anwsun.phya.utoledo.edu
Message-ID: <1992Nov19.214336.88@uoft02.utoledo.edu>
Source record: 214456

how do SyQuest 44/88meg removable drives compare to flopticals?
i'm especially interested in price. i'm leaning toward the SyQuest
systems at the moment (bigger, faster), but i'd like to find out
what the price margin between the 2 is.

how much do the basic drives and disks cost?

Concerning recent revelations about the memory needed for MGIF 4.0! I have ONLY 2.5 meg total and I got some (small) .gifs to show! The largest one I got to work was still less than 100K, so I guess it still eats up most of the 1meg I had free when I ran it. It's a pity it eats up so much ram as the results are to say the least outstanding!!! I guess the moral of the story is to ask for 2-1meg SIMM's for christmas :^)

>
>Thanks to all!
>Markus
>

Funny you should ask...

I was just wondering the same thing myself, and was messing around with
an archie server looking, and found nothing...
except the source code to a Un*x version... I don't know much about the
various versions of HYTELNET, but since this source uses the curses screen
management library, I was able to (with very little difficulty) compile it on
the Atari. I'm not sure what the legalistics of it are, but if I can, I will
test it (well, I know I can do that) and upload it to a.a.u.e. If I can, I will
also include the latest version (6?) of the data files...

From: bq035@cleveland.Freenet.Edu
Message-ID: <1ehqaqINN637@usenet.INS.CWRU.Edu>
Source record: 214463

I remember reading in (was it a BRE Software ad) an ad for some PD software company, that there are two versions of the Xformer. It said that 2.55 does not handle P/M graphics, but that the other version does. I've tries using 2.55 with some of the 8bit software from a.a.u.e, but it tends to crash.
I'm either doing something wrong when I load (it's been a long time since my 400 :-), or I have the wrong version. Is there anyone who uses the Xformer enough to be able to answer questions about it?

I have a Quantum 52 Mb drive and a SyQuest 44 Mb removable with an ICD AdSCSI host adapter. The SyQuest is a little slower than the Quantum, but both are about twice the speed of my old Supra 20 Mb, which may have a Seagate mechanism. They are also MUCH quieter than the Supra. I believe the SyQuest drives are fairly widely used, and are in packages for most 16 and 32 bit microcomputers (D*S, M*c, Am*g*, ...).

>thanks - also for any hints towards any good disc-recovering tools :-(
>
>Claus

If you can retrieve from atari.archive.umich.edu, there are some utilities there; I'm not familiar with 'DLII and Reorg'. I tend to backup truly critical data to floppy as I generate it, having lost my HD once or twice. Unless your fairly confident in your ability to manipulate FAT tables and sector structure of your HD, you're probably better off formatting and starting over. Perhaps you could try to recover critical data first, then reformat.

Amalaye Oyake writes:
> Does anyone have any info on Cumana OS/9 ?

By coincidence, I recently asked about it on comp.os.os9 because Cumana seems to be selling off their OS-9/ST packages for dirt cheap (~$200).

They include OS-9/68000 ver2.3 (one step back from the latest), assembler, C compiler, a bunch of ported Unix tools, and I think a version of Sculptor (a powerful 4GL database management system, which used to sell for $1000).

It does not include windowing, but I'm told that MGR is available. I think G-Windows may also be had (G-W is a pretty cool setup). I don't know costs. Oh. It does include MIDI port drivers, which the US-sold version from Microware did not (I've been running their version for several years now).

To answer your other questions, you might ask in comp.os.os9 for a copy of the FAQ, but in brief: yes, it's multitasking and multiuser (altho not super strong on security). Any terminal-oriented OS-9/68K applications should work on it (most have been ported from Unix). The Cumana version doesn't include networking. OS-9 is sort of an underground cult favorite for over a decade, because it's trim, robust, and pretty easy to learn. It's Unix-like in many ways, but is not Unix. I own a bunch of OS-9 computers myself, and earn a living from it as well (OS-9 is widely used in control systems - NASA, GM, Ford, Fluke, CD-I, MRI med scanners, etc).

Source record: 214667
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I am interseted in putting a reSOLUTION SUperVGA card into my 4 meg 1040STF.
My entire system is in a tower case so space is not a consideration. I would
like to know if anyone has this card card installed in a 1040STF? How east/hard
is the installation? I assume it must be a solder in card?

The only distributer that I know of in the US is Rio-Datel, and I was made
aware of there shady nature concerning the Lexicor software scame. Does
anyone know of any other dealers that may be able to obtain this card for me?
By the way the German company that manufactures the card is called "GengTec".

Many thanks,
Scott Kolodzieski

I got my TT-version of Llamatron from some archive. This could be
either atari.archive.umich.edu or sol.cs.ruu.nl. Check for llamabin or
llamatrn.

>
> (At least - if it DOES work on the TT, it'd be in ST-Low, with Cache turned
> off)

I am not sure in what resolution it work, but it doesn't matter, the
program switches to the correct resolution. But you have to set the
cache off (the program will work, but the sound are terrible then).

P.S. You have to be carefull with your joystick because this program
is a real joystick-demolisher.

Greetings,

Han.

WEll these dumb OZZy's should turn on there Brain, ! sorry I forgot the don't have one, and read more of the articles that are posted here... :-)..

Ultra-Pack 1.1R from memory was uploaded to A.A. some time back, but being a Ozzy you would not unstand that...

Get a brain transplant, a Pommy one could help a lot..:-)...

Then you would at least be up to our level here...???

One of the 5 million sheep and I don't have a brain...:-)...

Well I think I found it, its hidden in My Atari keyboard...???

Roger..... sheppard_r@kosmos.wcc.govt.nz

5723. GEMVIEW 2

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 09:55:00 UTC
From: diane.karagian@idcbbs.uu.holonet.net
Message-ID: <80.1019.uupcb@idcbbs.uu.holonet.net>
Source record: 214531

I've gotten the GemView 2.01 from a.a, and I'm pretty impressed with its ability to display those lovely multi-color pics on my (medium rez) screen. I do, however, have two questions:

1) How can I save the pictures in anything other than X-Gem? There are a couple of other formats listed in the save dialog, but they're greyed out.

2) (Related question) Is it possible to do direct conversions, i.e. load a Spectrum picture and save it back out as a TIFF without color reduction, dithering, or anything else that would degrade the picture quality?

I realize these are probably answered in the docs, but since I read no German at all, the docs aren't much help. Any/all suggestions are appreciated.

Thanks in advance,
DK

Hallo everybody!

I've got an Atari 260ST and a HP Deskjet 500C printer, but I have'nt got
any drives for the HP featuring the color facilities.
Could anyone tell me where I can get such a driver?

Yours, Mark.

I can live with playing it from floppy, what I found hard to live with is the escorts sailing straight through a tanker to attack you and the way sonar works when the vessel is doing 30 knots. Oh and one other snippet is when your lookouts spot a battleship at 180 yds range it's a bit too late.

That is even better. It may take a minute or two to install, but then
it is even a bit faster then from harddisk!

>(I suppose I would be looking for something like word for windows 2 for the PC)
>(apoloyises for mentioning PC in this group :-))

I also recommend LaTeX. One problem however is that you need to learn LateX first. Get hold of a book on LaTeX, especially the one by Leslie Lamport.

If you don't want to take that route, then you may consider buying Calligrapher professional (from Working Titles in UK). It's got a very good equation editor as well as a Table generator & whole lot of goodies suitale for technical wordprocessing.

Hope this helps.

> method (or, more accurately, a SHORTER method, as that way would increase
> the filesize by almost 1k - and something as simple as this program should
> not be too big!!)

- How about using Assembler ? You can`t get it any shorter than with that!

- Try reading the DTA, then you can read the date/time of the file
out the DTA-structure.

- Another simpler, faster way is to write a NAME.INF file. Okay, so you
two files now, but I guess a prog like that will probably run
in the AUTO folder, so what, you`ll never get to see that file than anyway.

This way however you can output/input the date-time via get/put
(input/output) fast and efficient. When using GFA-Basic, better
use Gemdos (or was it Bios one should better use, when
thinking of the new TOS versions?) commands, that way your prog is `cleaner`.

From: edwardc@aifh.ed.ac.uk
Message-ID: <1992Nov20.114959@aifh.ed.ac.uk>
Source record: 214483

Regarding LaTeX on the ST. I should say that it is possible to get a reasonable working copy of LaTeX onto a 1MB ST with a single double-sided floppy drive. This includes: CLI, Tempus2 editor, LaTeX, Previewer, DotMatrix output and ~400K
of spare disc space. Disc swapping only occurs for previewing and printing.

Of course, this situation is still intolerably inconvenient and V E R Y S L O W
but, if you have limited access to more powerful machines and no hard drive, you
should still know that you CAN do it with a single floppy.

LaTeX is still the only real choice. You might look at Signum2, but that is very limited in comparison.

Source record: 214485

About the bus in the Falcon. I have seen two messages from John Townsend.
One said the Falcon had a 32bit bus and this latest one says it doesn't.
Personally I don't care. It will be faster than my ST, with better graphics and
thats all that matters for me...

BTW I don't even know what the bus is anyway :-)

Also, isn't it possible to remove the 030 processor and replace it with a faster
one, like the 50Mhz 030 in the SST accelerator?

Surely this must make a huge difference in speed?

5736. Redirection of printer output?

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 12:16:47 UTC
From: thiele@quando.quantum.de
Message-ID: <1992Nov20.121647.13527@quando.quantum.de>
Source record: 214500

Hello everybody,

I have a question to MiNT, and I hope, that someone can help me:

Is it possible (under MiNT) to redirect the printer output (i.e. the
data which will travel to the centronics port!) into a file?

I want to collect the print data from a GEM PRoGram into a file (and
manipulate the escape sequences), but I cannot manipulate the program,
so that I have to steal the data "from the centronics port".
Is it possible to redirect the printer output, maybe using the `/dev'-di-
rectory? I am using MiNT 0.95.

Thanks in advance

Holger

If the memory is already 32-bit wide (for COMBEL & VIDEL) then why
not make the 030 have 32-bit access? It seems that it would not add to the
cost at all since the memory is already 32-bit wide.

>I don't understand German, and I cannot make heads or tails of the
>instructions!!

From what I've determined, Winx works only on German Roms, so I guess the answer to you question is yes and no. I'd heard the author was going to add US 1.4 ROM support, but that hasn't happened yet, and no one in NA has tried to figure out what the differences are and patch it. I traced through the program for a few hours, but never went back to it. So for now, you're only real way of using it is to obtain German 1.4 roms and install them. Or get into assembly hacking and fix the WINX program. I'm guessing the author found a sysrem routine that checked window open limits, and patched around it. Obviously musch of the GEM code must be open ended enough that there's a limit check holding the window limit down, unless the author of Winx rewrote a lot of routines.

>Codeheads!!!

Since the floptical is treated as a hard disk, is it possible to partition
it to 16 and 5 MBs? I have TOS 1.02 and 2 MBs of RAM.

I have a choice: a floptical or a TOS & RAM upgrade to my Mega 2.

Recommendations anyone? I'd be sorely tempted to get the floptical since I
PLAN to get a Falcon some time (probably late) next year.

Later,
Kenneth Love

5747. Comparing ASCII files

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 15:13:22 UTC
From: kllove@wildcat.ecn.uoknor.edu
Message-ID: <By0syG.I3G@constellation.ecn.uoknor.edu>
Source record: 214505

I need to be able to compare 2 ASCII files.

The output should be switchable between matching lines and differing lines. Also, it would be nice, but not necessary, to have the program ignore white-space before and after text.

Any ideas?

Also, I would like to be able to remove white-space before and after text. The reason for this? I have some dBASE program files (from a PisC DOG) that have been manipulated by so many programs (conversion between dBase II -> III -> III+ -> DBXL -> QuickSilver -> Arago DBXL/QuickSilver and SCAN-a-Lyzer! BTW, if anybody uses Scan I've found a slight bug in its "Re-format" option. E-mail me for details.) that somewhere along the lines MANY extra spaces have been added to the end of lines that is COMPLETELY unecessary. This system takes up 2.7 MBs of space right now. I think it could go down to 2.4. I don't think the compiled code (3.1 MBs w/overlays -- blech!) size changes (it shouldn't!), but I'd prefer the more compact code anyway.

If you have seen/heard of a program on the Atari or those Klone machines, please point me in the right direction. (Short of c.s.ibm.* groups that is! :)

Ramblings from,
Kenneth Love

Hello!

There are some programs doing that. Some examples are available via
anonymous FTP from ftp.tu-clausthal.de (139.174.1.3). Get
/pub/atari/disktools/other/dblefeat.lzh and/or
/pub/atari/disktools/other/divert13.lzh
With these programs you can change any drives by software (e.g. C <-> D)

Bye,
Wolfgang.

5749. Falcon accelerators

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 15:50:30 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Nov20.155030.11287@newshost.lanl.gov>
Source record: 214499

Since so many prospective Falcon buyers seemed to be "concerned" about the Falcon's 16-bit data bus, be advised that technical wizard and hardware guru James Allen, IAAD member and owner of Fast Technologies, believes he has already come up with a workaround for adding an accelerator for the "bird." Whether it ever sees the light of day will depend on how well the Falcon sells, of course. Just remember Dave Small's favorite addage...

"Speed costs money. How fast do you want to go?" :)

>a bigger waste of time than simply having Atari recompile TOS using an
>optimizing 68000 compiler instead of relying on a 1985 compiler. Sure,
>the hand coded assembly language version might be a little smaller and
>a little faster, but you'd be surprised at what a good C compiler could do.

I agree entirely - I have looked at the VDI/AES code too and it is absolutely dire and hasn't changed in later versions of TOS. This lead me to the conclusion that Atari must have lost the entire GEM source code at some time - this would explain why they haven't recompiled it and why they have had such difficultly making modifications to it (And when they do, more bugs creep in). However, the source to the example CPX that Atari provide compiles to literally half the size using Lattice C5 compared to their precompiled version. What is more their code is totally non-ANSI (no prototypes etc.) which seems to indicate they are still using the same old compiler.
Another possiblity is that Atari are unable to recompile the GEM parts of the operating system due to legal problems - I remember a few years back that Apple or Microsoft (or somebody, although not Xerox!) took action that meant Atari could not update to the latest PC version of GEM in their machines.
Back to what you said about algorithms - why is there an incredible pause after the desktop reads a directory from the disk and before it starts drawing the icons? What is it doing? I can only assume it is doing something like a bubble sort on the filenames, except instead of juggling pointers copying the filenames backwards and forwards. Does anybody know?
I didn't know the story behind the inclusion of Line-F system before - I always thought it seem an extreamly slow way of doing things.
Interestingly some of the line A functions are actually very well written - I tried to write a fast resolution dependant line drawing routine in assembler once, using the best algorithms I could find in books and in the end used line A because it was so very nearly as fast.

Conclusion:
Rewrite the VDI and AES in C then compile it with a good compiler this should give a 40% speed up at the very least (switching on all optimisations on Lattice C gave literally a 50% improvement in a Dhrystone bench mark, and the code with all optimisations off looks alot better than that in TOS). You can then always hand assembly code time critical sections. The entire code should take up less than 100K of RAM (remember it's just the GEM parts you're rewriting).
Then sell the source to Derek for recompilation to 386 code for his

Gemulator which would then be usably fast on a sub #1000 PC (if not too fast).

- Leo

Robert,
If there supposed to be jumpers, then they are probably "Zero ohm resisters",
(jumpers that look like resitors). Makes it easier for board stuffing
equipment to deal with.

Regards,
Doug Sr.

>
>how much do the basic drives and disks cost?

Both the Syquest 44/88Mb units and the Floptical drives are SCSI, removable media drives. The Syquest units actually _are_ hard drives, just with removable platters. As such, they are fairly fast, roughly 25ms average access time (another worthless speed rating) or on a par with most low-end hard disks. Since they are SCSI units, you must have a host adapter to convert your Atari's DMA signals to SCSI (unless you have a TT in which case it just plugs in). ICD's famous Advantage Plus host adapters work well but the newest rage is their LINK adapter which is a small self contained host adapter which simply plugs onto your drive's SCSI port and you run your DMA cable from your ST to the LINK and use ICD's software to manage the whole thing. Very nice. Syquest 44 drives read/write/format 44Mb cartridges. Syquest 88 drives can read 44Mb carts but can only write/format to the 88's. There was some scattered consternation about the durability of Syquest carts some time ago, but from personal experience, I've found them to be _very_ durable and reliable.

The floptical drive is relatively new on the scene and has the capability to read/write/format standard 720K floppies, 1.4Mb "super" floppies and the new 21Mb optical floppies. And although some 2-3x faster than a standard floppy drive, they are considerably slower than a real hard drive. Their beauty lies in their very compact size and portability, especially when used with ICD's LINK adapter. It's also nice to put a 21Mb floptical disk in your shirt pocket. Oh yes, in order to format 720K/1.44Mb floppies, you need the latest version of ICD's software which comes with the LINK.

You can shop around, but _typical_ street prices are something like:

Syquest 44 external with case, power supply, cable, ICD host & 1 cart... $ 650
" 88 " " " " " " " " " ... $ 750

Syquest mechanisms alone can be purchased for about $200 less than the above. Additional Syquest 44Mb carts run about $65-75 each; 88Mb carts $110-120.

Floptical external drive with case, power supply, cable, LINK & 1 cart...$ 480
Additional floptical 21Mb carts run about $25-35 each.

ICD LINK adapter alone... $90-$100
ICD Advantage/Advantage Plus host adapters... $90/$100

While widely available, a highly recommended source is TOAD computers in Baltimore, MD, 1-800-448-TOAD. Also, Purple Mountain Computers in Bellvue, WA, 206-747-1519, recently had a very attractive price on floptical drives w/LINK at $399 but I'm not sure if that price is still current.

Hope this answers most questions about Syquests & Floptical drives.

From: afraser@uwovax.uwo.ca
Message-ID: <1992Nov20.141217.1@uwovax.uwo.ca>
Source record: 214515

Well, I am in the process of trying to back up my hard drive. I thought
that I would get clever and arc together a whole bunch of files along
a certain path and then just back up my collection of arc files.
(Figured that this would mean less floppies needed.)
This process led to a couple of arc files
in the size of about 1200K or more. I thought that turtle could handle
long files by just splitting them up (in the sense that uue does); but I
was wrong. Is there some other good back-up (public domain or shareware)
program for which this feature is available?

Adele

I think we might put this in the FAQ, so that we avoid any new lzh,
zoo,arc,arj, you-name-it wars.
If you want good lzh archiver for UNIX try :

Host akiu.gw.tohoku.ac.jp

Location: /pub/unix
DIRECTORY drwxr-xr-x 512 Apr 1 17:44 lha

(I'm not sure if it's up on a.a.)

It has man pages in kanji, but i don't think you need'em. It's quite
easy to get it running, and it's compatible with Quester's lzh (which is
what you want)

Jarle.

>2nd cover disk. (issues #39, #40, #41 and if someone has inside knowledge
>#42)

I was just gonna give an angry reaction saying: when did ST Format ever put a goodie on their cover disk, when I remember last year they put my AutoRaiser on the cover disk! The basters did that without even sending me a letter telling me they used the program. It was sort of good luck I was in Leeds, UK by the time and someone showed me the magazine with my name in it. Not many of my Dutch friends regularly read the monster. I think advanced atari users in Holland prefer the German magazines. At least I do.

Well that would be a test concerning ST RAM, which after all could very well
be on a 16 bit data bus, and the TT would still be 32 bit (provided you get
yourself some neat TT RAM).

5768. Jekyll v1.37....OUT NOW!

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 19:11:02 UTC
From: Vincent_Partington@p15.f202.n281.z2.fidonet
Message-ID: <2b0d38a5@p15.f202.n281.z2.fidonet>
Source record: 214593

Have you ever been jealous of those MS-DOS modem freaks who were bragging about BiModem?
Have you ever wondered why only one side of your modem is being used, while you are sure the thing can send tow ways?
Have you ever felt there could be more than ZModem?
Have you ever been bored while downloading?

Then Jekyll is the just the thing for you!

Jekyll is a full duplex file transfer protocol that allows your modem to send files both ways and what's more: you can even chat with the other side at the same time and the CPS rate won't drop noticably. It can even go up if you're sending uncompressed files because Jekyll will compress them before sending and decompress them automatically when receiving!

All this and more can now become part of your everyday life if you use Jekyll v1.37!

A quick overview of it's stunning features:

- Full duplex files transfer (send files both ways)
- Split screen chat with configurable magics (words automatically being replaced by alternatives) and function keys
- Real-time data compression, unseen until now. Can compress executables up to 30% and text files up to 50%!!
- File selector built in so you can select files while sending the previous files.
- Host-mode: scan the hard disk at the other side and request files from it. Useful for BBS's and normal users. BBS's can set all sorts of limits so their users won't get more than they're supposed to!
- File-viewer, to read something while downloading
- A small terminal to quickly make a data connection
- Lots and lots more.....

The new features in v1.37 when compared to v1.32 are:

- Progress bar
- GMUS-protocol support: select music files for GigaMusic and Ultraplayer from within Jekyll! (Ctrl-M, Ctrl-Cursors)
- Switches have been reassigned to four letters so their meaning is clearer
- Made MiNT/MultiTOS compatible
- Chatlog, saves everything you and the remote type in a file (-cout, -c_in & -chat)
- Environment variable for configuration (JEKYLL=)
- Files can be automatically deleted when succesfully sent (^..)

- Screen routines imporved, now work a lot better when Jekyll's own screen routines have been turned off, no more juddery scrolling
- TT-ports can be used (-port)
- Cache size can now go up to 64K and caches are now dynamically allocated
- 4K-Caches for (chat)logfiles
- Jekyll now returns a return-code, it is the amount of kilobytes sent, this can be useful for level-calculations if BBS's use the host-mode
- Host-mode now by default OFF, some sysops complained about it being by default on
- Bug fixed that caused Freeze Dried to run Jekyll a few times when you installed it with an autostart-string and that caused QuickBBS to sometimes get incorrect descriptions like "Jekyll v1.32" etc.
- Many bugs fixed and other small features added....

You can get this file at ST QuickBBS Haarlem +31-23-340077 (JEKL137.LZH) and I'll ftp it to atari.archive in a couple of days. There the name of the file will be jekl137.arc.

All right, I tried all the suggestions to get Llamatron to work on a TT (i.e., ST-low, cache off, internal speaker off, RCA jacks connected) and none of it works. It loads, the screen turns red, and it locks up. (FYI: I have TOS 3.05).

Why is this so strang? In a TT, the 68030 is running at 32 MHz, and TT-RAM is 32-bit, 32 MHz. But everything else--ST-RAM, DMA, vidio-- is all at 16-bit, 16 MHz. And I get about 4x the speed with only ST-RAM, running the same program (no 68030 or 68882 commands).

>>Codeheads!!!

According to Ray at TOAD Computers, this is not so. You _can_ format 720K and 1.4Mb floppies in a floptical drive... you just need the latest version of ICD's software which comes with the LINK SCSI/DMA adapter. There may be a problem doing so with TOS's prior to 1.4 but I cannot confirm that as yet.

>I have a choice: a floptical or a TOS & RAM upgrade to my Mega 2.
>Recommendations anyone? I'd be sorely tempted to get the floptical since I
>PLAN to get a Falcon some time (probably late) next year.

Well, I'd say it probably should depend on what you use or want to use your computer for. If you can't run larger apps because of memory limitations, then go for a RAM upgrade. The TOS upgrade is _always_ a good idea and gives you a lot of bang for the buck.

However, if you really intend to buy a Falcon soon, then don't put any more money into hardware upgrades for your Mega. And if you don't have a hard drive or don't plan on buying a Falcon with the built-in hard disk, then I'd recommend buying a fixed hard disk BEFORE a floptical. Hey, the flopticals are neat but they are NOT the best solution for primary storage! At any rate, an external hard disk or a floptical could be used on _both_ systems.

I'm looking on information pertaining to the following:

TOS 2.06 or 3.XX cards for older St's (or Mega) computers.

Availibility of a method of loading from hard disk the newer system instead of hacking them into the machine.

Use of TOS 1.4 and 2.06 or 3.XX in the same maching (switchable?)

Any info on the above would be greatly appreciated! Please mail to me sonce I rarely use this newsgroup anymore due to lack of time.

Thanks much!

>
>Nah...Amiga was just being 'courted' by Atari, along with Commodore. I believe
>Atari sued on the basis that they courted first, even though Commodore got the
>dope.

According to a recent article on Atari in Computer Shopper (either
March 92 or October 92), Warner, who owned majority stock in Atari (at
the time), also had invested in the Amiga company. Jack T. was
disposed of at Commodore and then later courted by Warner to buy most
of Atari. After Jack T. bought it (at a very good price according to
Computer Shopper), he persuaded many Commodore people to Atari. This
left Commodore crippled so they bought up the Amiga. Jack T. sued on
the basis that since Warner had a stake in Amiga so did Atari. I
think it is true that Atari got a cash settlement, but according to
this article the merits weren't enough such that Commodore would lose
the Amiga.

From Atari Explorer 92-14

CODEHEAD ANNOUNCES WARP 9 (3.71)
CodeHead Technologies ups the Fun Quotient in the Atari world with Extend-O-Save, the modular screensaver in the new version of Warp 9! No longer do you have to put up with the same dull screensaver graphics day after day -- with Extend-O-Save the possibilities are almost limitless. Warp 9 now comes with 5 screensaver modules (maybe more by the time you read this). The method for writing modules will be freely distributed, so any programmer will be able to write new modules at will. PinHead is now built into Warp 9, so you can remove one more program from your AUTO folder. Full automatic control of the 'fastload' effect for specific programs is included, just as it was in PinHead. A revamped Warp 9 Control Panel, with new controls, and an improved 'Save Config' option. To upgrade from any previous version of Warp 9 to the new Extend-O-Save version, just send us your original Warp 9 master disk and a check for $15.00 (includes postage and handling). When you mail us the disk, there's no need for a special envelope or disk mailer; simply put it in a normal letter-sized envelope and drop it in the mailbox. If you own any version of Quick ST or Turbo ST, you can upgrade to Warp 9 for just $30.00 by sending us your original disk and a check. (The previous limited $20 upgrade offer has been extended at this new price.) The retail price of Warp 9 is $44.95. CodeHead Technologies, P.O. Box 74090 Los Angeles, CA 90004, Phone: (213) 386-5735 (Mon-Fri 9A-1P PT), FAX: (213) 386-5789, BBS: (213) 461-2095

5778. GEMULATOR - a second look?

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 22:50:27 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Nov20.225027.26914@newshost.lanl.gov>
Source record: 214533

There has been quite a lot of discussion on the net, much of it negative, about the Gemulator... the Atari ST emulator for IBM PC's and compatibles. I myself, in fact, have been responsible for some of the negative "vibes" which at the time I considered quite justifiable.

Well, time marches on and as it does, things change... and so do opinions. :)

I just recently received my Gemulator 2.0 software upgrade and I must now admit, it's come a long way since the first release. Most of my original complaints about the operation and use of the device are now history or at least, very close to being resolved. Running on my 486-33, I find the software now roughly equivalent in performance to an 8MHz ST, which is what Darek Michoka, developer of Gemulator, promised all along. The few nasty incompatabilities which plagued me before are fixed (including GFA BASIC 3.5) and my unit now reads/writes to my floppy drives with no problems at all.

While I _still_ do not consider the Gemulator (in its current form) sufficient to totally _replace_ my Atari computers, I do now find it a worthwhile addition to my hardware suite. And even more importantly, I am satisfied that Darek will continue to enhance the software as time goes on.

Just for comparison, some of you "old timers" out there will remember the early MagicSak Mac emulator that Dave Small produced through Data Pacific. If you recall, that little device worked, but had many problems, some minor and some not so minor, especially when hooked up with his Translator (which semi-allowed Mac disks to be read by the ST. Now compare those early devices to today's truly excellent Spectre GCR. What an improvement! I liken the Gemulator to be on the same type path. It works, but will get a lot better.

And so my fellow Atarians (sheesh... what a ham!), I do NOT suggest that you immediately trash your Atari and run right out and buy a PC with Gemulator. Seldom will an emulator ever be "better" than the real thing. However, I do suggest you look at the Gemulator with an open mind. If you already own a fast PC, it has the potential to make your system even more productive.

I apologize for the length of this post, but I wanted to clear the air a bit. Please don't flame me for trying to be fair, open and honest. If you insist, however, please do so via email so we don't waste precious bandwidth.

We now return you to your regularly scheduled newsgroup... :)

5779. Answer to trivia question (early Amiga)

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 22:52:11 UTC
From: rvenable@helix.nih.gov
Message-ID: <1992Nov20.175211@helix.nih.gov>
Source record: 214532

Back when everyone had 8-bit computers and all the
flame wars were between Atari 800/1200/130 folks
and Commode Door 64 owners, a 16-bit 68000 machine
was being developed called the Amiga 'Lorraine'
(or was it Larraine?). This was before the Apple
Lisa, the MacPredecessor. (More trivia.)

For the grand prize, a week in non-virtual reality,
what were the code names for the Atari 400 and 800
during their development?

>RAM, running the same program (no 68030 or 68882 commands).

Your TOTALY wrong!!

The only tru statement is that the 68030 runs at 32Mhz!!

The TT-RAM is 32 bit wide and is clocked by a 16 mhz clock. Synchronous
transfer and burstmode combined with the internal cache of the cpu gives
it a resonable, but not maximized, performance!

The ST-ram is 64 BIT wide, but the CPU accesses it through a 32 bit bus.
the videoshifter accesses the ST (video) ram on a 64 bit bus (that's why they
can rip a 110mhz pixel clock off 100ns RAM-cips, which would be impossible
on a 32 bit bus).
The TOS-ROMs is also 32 bit wide (thats why there are 4 of those 256k*8bit
EPROMS in it)!

All other ST/STE/MSTE compatible hardware is 16 or 8 byte wide, and so is
also most of the TT spesific hardware that is not mentioned above!

I have taken this information from the schematics of the TT, so there should be
no doubt about it beeing correct!

5781. Free MSTE/TT CyberDrome upgrade

Newsgroup: comp.sys.atari.st
Date: 1992-11-20 23:15:47 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Nov20.231547.834@newshost.lanl.gov>
Source record: 214534

```
*****************************************************************************
* Fair Dinkum Technologies Press Release *
*****************************************************************************
```

Fair Dinkum Technologies is offering a FREE MegaSTe/TT upgrade to all registered owners of "CyberDrome-The Hoverjet Simulator", the 2-player/2-computer real-time simulation from RHEA-FX and Fair Dinkum Technologies.

Thanks to our users, we have discovered that owners of faster Atari computers such as the 16MHz MegaSTe or 32MHz TT have experienced extreme difficulty in successfully completing any of the upper levels of CyberDrome. We investigated and sure enough, we found a timer problem when used on 16/32Mhz computers. The program still worked, it just made the difficulty level higher than intended.

Therefore, those who returned their product registration cards or purchased CyberDrome direct from Fair Dinkum Technologies may receive this free upgrade simply by requesting it. If you purchased CyberDrome from a retail store and have not yet returned your registration card, do so now and request the free upgrade at the same time. There is NO need to return your original disk. The error was ours, not yours, so we will send you a free, postpaid patch disk.

NOTE: This upgrade affects ONLY Atari computers running faster than 8MHz!
If you own an unmodified, 8MHz Atari ST/STe, there is no need for the upgrade.

If you want to know more about CyberDrome, simply send an email request. Thanx!

```

TOS 1.0 was available on disk, but none of the later versions (except for a
few fairly buggy beta versions which were for developers only).

The TEC (TOS Extension Card) offered by CodeHead Technologies has the option
of an external switch to allow you to switch from your normally installed TOS
to the TOS 2.06 on the card. It retails for $139 and includes the TOS 2.06
chips. You might check with them at (213) 386-5735.

P.S.: I tried to email this but it was kicked back.

5783. Re: SyQuest vs. floptical

Newsgroup: comp.sys.atari.st
Date: 1992-11-21 00:36:09 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1992Nov21.003609.10437@elroy.jpl.nasa.gov>
Source record: 214538

Pretty good summary. I'd just add a couple notes - bare Syquest 44MB drives are around $300 from various places in Computer Shopper, and bare 88MB units are only in the $400-450 range. If you already have an existing SCSI drive setup there's no reason not to buy bare units to just add in. The cartridge prices have been pretty consistently in the $65-75 and $110-$120 range that John quoted... Personally I want speed more than portability so I prefer the Syquest over the floptical technology.

>1. I've never heard of Ultra-Pack. I certainly don't have a copy.

As I said in the message (if you read it). It is available in the
atari/Archivers/
directory at the atari.archive.umich.edu FTP site.

>2. What's wrong with CONTRIBUTING to the existing FAQ?

Because there's a pretty good chance, once anyone has seen it once, they
won't bother to read it again. Hence - any good additional info', will
most probably not be seen by them - so an entirely new one, with some
slightly more advanced/common info' might be more useful to some people!?

5785. Re: lzh unpacker for unix

The sources for (TOS) LHarc were in the archivers directory on a.a.

Whether compiling the standard sources (which are in assembler) into UN*X
would work - is probably unlikely.

For Cyber stuff, check out E. Arthur Brown. Their catalog lists CAD-3D, CyberSculpt (which is also available from Lexicor now), etc. (I don't recall seeing CyberPaint in there, but then again, I wasn't that interested in it, as I have Lexicor's Prism Paint - which BTW is not all that expensive.) I also have Lexicor's Chronos-3D, which is pretty cool. It seems to have a few bugs, but I haven't talked to Lexicor about them yet - I have one more tutorial to work through, and then I'll have them all in one net :-) Chronos is a bit expensive at about $200, but it's probably the most powerful 3D animation program available for the ST/TT. And Lexicor, unlike Antic, is still around and supporting their stuff (they are even official Silicon Graphics s/w developers now, and are porting some of their Phase IV s/w to SGI machines). One thing though, Lexicor does not have their own 3D modeling program for the Atari - you need CAD-3D (and optionally CyberSculpt, etc.). Or, if you don't want to design your own objects, get Rosetta-3D and you can translate a host of different 3D object formats to Lexicor's .3D4 format to use with Chronos.

That is totally wrong! The videomemory on a TT is 64 bits wide according
to the docs I read. It multiplex that data to 32 bits for the 68030.
Allthough the videobus only uses 16MHz as you said.

5790. ATARI - Secret

Newsgroup: comp.sys.atari.st
Date: 1992-11-21 06:55:08 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.2awi@terapin.com>
Source record: 214545

It seems that ATARI may have had it together all along, but kept it a secret, which caused it to loose support and... well you know the rest.

I was reading some messages on the stuff available for the ST, what really interested me, as well as surprised me, was the graphics cards for the ST. I own an ATARI 1040 STE... You can upgrade it to 4 megabytes of ram, put a high resolution/color card in it, get tos 2.07, get a 25 mzh accellerator, 1.44 megabyte disk drive, big hard disk, multi-sync monitor, and some programming software like Lattice C for the ST, and you have a machine which is "up there" with the rest, and a programmable machine with many possibilities.

Of course, I will wait for the Falcon instead.. I am happy to have read that there is already a graphics card waiting for the Falcon, at alot higher resolution on a SuperVGA monitor.. I'm glad, I thought the resolution was to low to begin with..

So with the proper information, software and upgrades.. Those who are interested in developing don't have to feel bad about it.. There is actually enough ST stuff to keep us happy, we just have to look for it.. Not like the other computer companies, that try to help the users.. I still think its worth it..

So I'll get a Falcon, upgrade it, make some nice software and put on the package "REQUIRES 4 MEGAYBTES OF RAM, AND A FALCON SCREENBLASTER". With the DSP chip, sound quality, video and memory, I think one can make a great CD ROM Based game or even a Really proffessional program.. Maybe even a hardware/CD ROM package that can blow away the AMIGA's Video Toaster.

Please tell me what you think about this, and if any of you share these visions with me.

Maybe you want to put "alias mem \my\favorite\mem.prg" into your gulam.g.
So you avoid using it by accident especially when switching shells.

> Look at the MIDI ports on the left side of the ST... WITH NOTHING PLUGGED INTO
> THEM!

> How can they claim to know anything about the ST's use in music, and not even
> have the computer set up right in their ads?

WHAT YOU DON'T USE VAPOR CABLES FOR YOUR MIDI ??!!??

But Seriously. Whenever you take pictures of equipment you try to present
the concept in the cleanest possible way. If I remember that ad correctly
the mouse appears to be connected to the rear of the system. Next time
you see a person using an electronic gadget in the movies or on TV look
for what's missing. It will surprise you. (Hint on TV you NEVER have to
extend the antenna on your cordless phone.)

BTW did anybody notice the MegaSTe on the Sunday night movie a couple
weeks ago. I forget the title, but this guy was some kind of composer
and in his living room was an Atari "wedding cake". It could have been
a TT, I could not read the label.

>software like Lattice C for the ST, and you have a machine which is "up there"
>with the rest, and a programmable machine with many possibilities.

I'm not an Atari basher or anything, but I definitely believe that the company
doesn't have everything together.

I believe that their marketing strategy for the Falcon030 sucks.

I believe that the Falcon series is doomed unless the Falcon040 is shipping
within six months.

I believe Atari's "12-key keypad, three button joystick" was thought up by
an idiot.

You have the world using JOYPADS and you are going to introduce a complicated
12-key keypad joystick!

Every system on the market in the past that used a 12-key keypad was a FAILURE!

I don't believe that Atari has more than two dozen large developers working
on products for the Falcon030. I believe that Sam was leading us to believe
that there are developers, but in reality he is HOPING that a hell of a lot
more cmpanies will develop for it when it is actually in stores.

I believe Atari was leading us on in September that we will actually see
the Falcon030 in October, November, or December because they didn't want
to see us abandoning them.

I don't believe that Atari will have any CHAIN computer stores selling the
Falcon030. I don't believe more than two dozen dealers will sell the machine
nationwide.

I don't believe Atari will have ANY press for the Falcon030 EVER which will
ultimately destroy the company.

I believe someone that is capable of fixing the above problems should be
running the company.

I don't even know where the problems exist. Is it in Atari USA or Atari Corp.?

>
>Of course, I will wait for the Falcon instead.. I am happy to have read that
>there is already a graphics card waiting for the Falcon, at alot higher
>resolution on a SuperVGA monitor.. I'm glad, I thought the resolution was to
>low to begin with..

Pretty soon, the Falcon030's resolution will suck if Atari doesn't get it on
the market fast.

>
>So with the proper information, software and upgrades.. Those who are

>it..

Do you actually believe that there is enough ST stuff to keep you happy?

Do you believe the 2600 will keep you happy even though there is Sega Genesis
and Super NES on the market?

My friend told me to get a clone instead of an ST. I would have except that
I like to be part of the minority.

>
>So I'll get a Falcon, upgrade it, make some nice software and put on the

Hahahaha, yeah, Atari's developers did their job, now its up to Atari's
management and marketing team.

>
>Please tell me what you think about this, and if any of you share these visions
>with me.
>

My vision is that YOU are a DREAMER!

I don't see any go-getters at Atari, so I dn't believe the company will
ever get going.

Not to drift, but does Warp9 work with MiNT .95 and Toswin?
I have an old version of Quickst and it will work except when I start up
Toswin. I get a cursor in the menubar and all console i/o just spits out
all over the top of my toswin windows. I really like the speed improvement
but if it doesn't work with MiNT, what's the use.

Thanks, Randy

5796. sed or 'filename matching' source code

Newsgroup: comp.sys.atari.st
Date: 1992-11-21 16:34:55 UTC
From: sslee@micromed.com
Message-ID: <w9kLuB3w165w@micromed.com>
Source record: 214554

I don't have access to 'ftp', so could someone mail me the source
code to the Unix utility 'sed' or source code to filename matching?
Filename matching would be like the following:
. match exactly one character
* match zero or more characters
[...] match any one character within the square brackets
Example: [ab] matches 'a' or 'b'
[a-z] matches any lower alphabetic character
[!...] match any one character NOT within the square brackets

Thanks,
Steven

>>Two questions...
>>
>>1> Anyone any ideas on getting my Mega/STE into 16MHz mode before
>>running games which boot from the bootsector?

>Here's an idea. Forget it. Most games "break the rules" and are so dependent on
>the system timing of an 8Mhz ST, that they just won't run in 16Mhz.

As i have an ADSpeed with an external switch, I'd like to point out
that most of the incompatabilities tend to be in custom disk load
routines, so with a switchable processor, a lot of games that won't load
at 16 will play at 16. You sghould see Vroom at 16mhz. Blows away some
dedicated arcade machines.
A local store claims to have worked out a way to wire a Mega STe
with a switch, but they won't say how they do it. Maybe someone with
access to the circuit diagrams would be able to figure it out and ost a
text file. One drawback, from what I'm told. If the switch is installed,
you lose the ability to software switch the speed, unlike the ADSpeed.

I think this is very true. So many people seem to be getting caught up in
the PC mindset, but I really don't think they have that much more to
offer. I get everything I need in a computer with my TT; if I want more,
I know where to look. Plus there's aspects of being an Atarian that are
irreplacable when moving to other platforms, like the user community.

>extra $$.

As another poster mentioned, Antic, the original publisher, is gone.
Lexicore is the only source of a Cad 3d like program, and from what I've
seen itt's way better. I read in an ionline magazine that someone got
the rights to Cyberpaint and has hired Jim Kent to update it for the
Falcon. Lexicore's stuff, from the demo's I've seen, would be awfully
slow on a stock ST, but it is very powerful.
Occasionally you'll see people selling Cad 3d on the net when they're
dumping their ST's.

> Interestingly some of the line A functions are actually very well written
>- I tried to write a fast resolution dependant line drawing routine in
>assembler once, using the best algorithms I could find in books and in the end
>used line A because it was so very nearly as fast.

Line A and Line F traps are a good idea and a bad idea, depending on what you use them for. A line A or line F instruction occupies 2 bytes of code, compared to 6 bytes for a typical JSR instruction. So if you make a lot of calls to the same routines, it becomes a great reduction method to use line F, which is exactly what the TOS ROMs did. The line F handler simply had a table of the routines and jumped to the appropriate routine depending on what the full 16-bit line F trap number was. Same goes for line A. The Mac operating system does the same thing with line A.

But, there is a certain amount of overhead with handling each trap, let's just say 100 clock cycles. A JSR RTS combination is only 36 cycles. If the routine you're calling takes thousands of clock cycles, the overhead is minimum. But if you do it every few lines of code like the TOS ROMs, you waste a lot of time in the line F handler. That's exactly why TOS 1.0 on disk (which uses no line F) is about 10% faster than TOS 1.0 in ROM. Of why TOS 1.4 in ROM is slower than TOS 1.6 in ROM. 1.4 has line F and 1.6 doesn't.

> Then sell the source to Derek for recompilation to 386 code for his
>Gemulator which would then be usably fast on a sub #1000 PC (if not too fast).

I'm way ahead of you there. When I sold off Quick ST to Codehead, I kept rights to the source code for just such a purpose. Already, Gemulator 2.0 has parts of Quick ST implemented in it as 386 code. That's what the QUICK option in Gemulator does. oooooh, pretty sneaky, huh? Right now, a chunk of VT52 and a little bit of VDI is implemented, so if you flick QUICK on, you'll notice about a 50% speedup in text and string redraws, and about 10% in VDI. As I do more work on it in the next few months you'll see the numbers go up more and more.

And this is a faster and more compatible thing to do than hooking trap handlers like Quick ST does. The QUICK option actually writes 386 code directly over top the 68000 in the TOS ROMs (since Gemulator loads them into RAM).

I'm not sure what you meant by "sub #1000 PC". Is that 1000 dollars or 1000 pounds? Right now you can buy 25 Mhz 486SX machine for under $1000, and that will give you roughly 8 Mhz 68000 emulation. You can still use the real Quick ST or Warp 9 running on Gemulator to give you the kind of speed ups you get on a real ST, since Quick ST does things in less code, Gemulator has to emulate less code and thus speeds up. Same reason it speeds up a real 68000.

> -Matt

Amiga was indeed the name of the company that designed the Amiga, although the working name of their computer escapes me at the moment. All I remember is that before Amiga got into the computer-designing business, they made/sold joysticks for other computers. Kinda appropriate that they should ultimately design a game computer...

>COmparing the 2600 to the Genesis etc. is STUPID! The thing is over 10-years
>old!! It was probably the first home-'console' system ever introduced.
>(Unless someone knows otherwise).

Oh, yeah? How old is the Atari ST?

It is getting up there as well.

Its just my opinion, but I DO FEEL like I'm playing with a 2600 (ST)
when I see what other systems are doing...

And PONG was really the first system, but it didn't play anything besides
PONG.

>
>Joy-Pads? Yuck - only small kids can use those things successfully - the
>buttons, and the 'joy-stick' are far too-small!! They are also crap for
>delicate operations. A good ole' Quick-Joy Jetfighter will do me nicely...
>It's big - easy to handle, has auto-fire.

YUCK? How many Nintendos, Super NES, and Genesis systems have been sold
with joypads?

I know many adults that play Nintendo and they don't seem to have any
problem with it. I guess it depends on how FAT your fingers are.

Besides, Atari could always make the buttons bigger.

TRUE, there should be a joystick available, but a joypad should clearly
be sold with the system.

It is not only cheaper to make, but it also won't scare away anyone.
If you hve over 5 buttons on the controller, it may scare away people.

And think about the future. If ever Atari joined the home multi-media market,
can you imagine a wireless joystick controlling the system? What a remote!

>
>12-key keypads failling? Most IBM compat's these days have 12-key keypads
>or something very close, and they sure as heck aren't 'failling'!

Do you know what the hell you are talking about?

Or are you just writing to see yourself write?

So, MOST IBM compatibles have a 12-key keypad on their game controllers, huh?

Mext message...

>

5814. Re: 1MB STE SIMMS: - are they 70ns?

Newsgroup: comp.sys.atari.st
Date: 1992-11-22 06:07:07 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <70010@cup.portal.com>
Source record: 214572

Re: questions about 1Meg SIMMs for the STe upgrades..

The ST only NEEDS 150ns memory. Buy whatever you can find that's cheapest.. normally that will be a 1 Meg x 9, 70ns SIMM.

Be sure to get either 1Meg x 8 or 1Meg x 9 SIMMs, not any other internal organization (those are usually more expensive anyway).

The STe can use either 1x8 or 1x9 without having to change anything.

5815. Re: Help! TOS 2.06 requires jumpers set...I have resistors.

Newsgroup: comp.sys.atari.st
Date: 1992-11-22 06:13:37 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <70011@cup.portal.com>
Source record: 214571

Robert Morrison asked about ROM select jumpers relating to installing TOS 2.06..

Those "resistors" marked W102, W103, etc. aren't resistors at all.. they're just jumper wires (thus the designation "Wxxx") which are manufactured to resemble resistors so automatic component insertion machines can handle them. (You could verify that with an ohmmeter).

You could simply snip them off the pc board and solder plain wires into the correct jumper pads for TOS 2.06.

The holes for the other jumpers are likely to be filled with solder from the wavesoldering manufacturing process, so that would have to be removed first.. no problem for anyone with soldering experience.

From: alien@clinet.fi
Message-ID: <1eni2uINNrq4@clinet.fi>
Source record: 214578

nickd@vpnet.chi.il.us (Nicholas J. DiMasi) writes:
: For Cyber stuff, check out E. Arthur Brown. Their catalog lists CAD-3D,
: CyberSculpt (which is also available from Lexicor now), etc. (I don't
: recall seeing CyberPaint in there, but then again, I wasn't that interested
: in it, as I have Lexicor's Prism Paint - which BTW is not all that
: expensive.)

Prims Paint is a good one too for frame editing but it's _very_ poor
painting program, only standard utilities. CyperPaint 2 is the most
powerfull paint prog. I've seen for ST, but it doesn't work on TT :(
I'm ready to pay a lot of money from working version of CyperPaint 2.
using that with other Phase-4 stuff and you can't find better
animation system for the Atari-line. Of course if Alias-software
starts support TT... PowerAnimator is the best modelling program, but
works only with Iris Power Series and IMB (<- sorry the uppercase)
RS/6000 power stations...

: I also have Lexicor's Chronos-3D, which is pretty cool. It seems to have a
: few bugs, but I haven't talked to Lexicor about them yet - I have one more
: tutorial to work through, and then I'll have them all in one net :-) Chronos
: is a bit expensive at about $200, but it's probably the most powerful 3D
: animation program available for the ST/TT.

Chronos seems okay to me, but it has very little shading options and
the quality could be much better. No raytracing and you need extra
program to do Texturing etc. There is also some German modeller for
the TT (only for TT?) and it isn't that expensive that Phase-4. It has
also Raytracing option and some object editor. InShape makes quite
nice effects, I can see some raytracing made on demo pics and it's not
even expensive: 498DM and there is all you need for nice modelling.

: still around and supporting their stuff (they are even official Silicon
: Graphics s/w developers now, and are porting some of their Phase IV s/w to
: SGI machines). One thing though, Lexicor does not have their own 3D modeling
: program for the Atari - you need CAD-3D (and optionally CyberSculpt, etc.).
: Or, if you don't want to design your own objects, get Rosetta-3D and you can
: translate a host of different 3D object formats to Lexicor's .3D4 format to
: use with Chronos.

Source record: 214581

Maybe my first response on the subject SS1 vs. SS2 was a bit too fast, since
I don't know SS1 well enough. Still, IMHO SS2 is worth its price because
it's one of the very few ST games I didn't have any problems with installing on
hard disk or with any accessories or progs in the auto-folder. It works fine,
sounds fine, looks fine and for me the missions are hard enough.

k>Since the floptical is treated as a hard disk, is it possible to partition
k>it to 16 and 5 MBs? I have TOS 1.02 and 2 MBs of RAM.

The floptical is handled just like a removable hard drive is. But why partition it? The 16 MB limit is not in old TOS versions, but in old hard disk drivers (AHDI below 3.00). As these old drivers can't handle removable media anyway, there shouldn't be a problem for you using the floptical media in one 21 MB piece.

so long, Peter

Well, the one thing that makes this sound believable is that once again Atari would have a hot new machine announced but unavailable over Christmas.

Steve

5826. Jekyll v1.38....BIG BUG FIXED!!!

Newsgroup: comp.sys.atari.st
Date: 1992-11-22 16:03:58 UTC
From: Vincent_Partington@p15.f202.n281.z2.fidonet

Hi everyone,

Apparently Jekyll v1.36 and v1.37 had one very big bug with the
RTS/CTS-handling in Jekyll's own serial routines. Because my modem doesn't
have RTS/CTS this bug managed to slip by, but Mario van den Heuvel has
notified me of it. I managed to fix the problem immidiately and meanwhile
some bugs in Hyde were fixed.
So please use Jekyll v1.38 and pass on this message. Thank you.

Ta!
Vincent

is E. Arthur still around? i don't own an ST anymore, but my dad still
uses his for drafting & wanted to get GFA Draft 2.0. he told me he's
stopped receiving the catalog & didn't know if they were still in business.

any idea?

Wrong.

We've all seen the improvements in GEM since TOS 1.4 (see Newdesk or the new 3D buttons, or MultiTOS' new AES for that matter). As far as I know, Atari currently uses different compilers for TOS development: XControl was compiled with TurboC or PureC, and MiNT is compiled with GCC or Lattice C. I'm sure that the same applies to AES.

> Then sell the source to Derek for recompilation to 386 code for his
>Gemulator which would then be usably fast on a sub #1000 PC (if not too fast).

If he really wanted to, Darek could buy DR's sources of GEM. Or, in fact, he could bundle a run time version of PC GEM and take advantage of it when emulating GEM traps.

gawk213s.zoo contains basically sources. There are really the same as sources for every other version of gawk. This program compiles on ST with gcc "right out of the box" with possible minor tweaks for other compilers/libraries.

Full gawk documents (this is a quite hefty package) can be found on many servers with a generic version of gawk. You need for them either TeX - for typesetting, or makeinfo/info from texinfo package (also on a.a.) for on-line screen viewing/printing on a line printer.

cawf2st.zoo is a re-implementation in C of awf (look in test subdirectory) which is an "awk formatter for man pages". Seems to me a little bit strange thing to do if you can have a full nroff/groff runnnig on ST and which will do man pages as well.

If you are not in a big hurry - pretty soon there will be a new release of gawk - 2.14. I am basically just waiting for a word from David Trueman than an official release happened. There are various improvements and fixes although 2.13 works pretty well by itself.

Cheers,
Michal

P.S. Could you, please, include a valid e-mail address in your signature. An attempt to answer directly to an address deduced from a mangled news header bounced back.

Use the version of Lharc that can handle lh5. Those files was probably
packed with unix-lha or amiga-lha.

Yes and no. The 68030 and your TT-ram (if you have any) in your TT runs on 32MHz, but all the rest is running on 16MHz (ST-ram, dma etc.)

I have not been using one of them, but I've been waiting for years
now to see scalable outline fonts on an Atari (without Spectre :-)

> 2. MultiTos is just being released for the TT, i.e. very soon.
"Very soon" ist the term they keep telling us for months now.
In my opinion, the delay in shipping Falcons is caused by the delay
in developing MultiTOS.

> Eric Smith, another fine Canadian, is now living in California and

Equalling a kick in the ass for all Unix developers who bought Atari
System V for an incredible sum of money. Luckily, I'm not one of them.

> <[Net 23] R.MARTIN22> Any signs of BIG NAME companies porting BIG

> Developer. I think you'll agree that they are a pretty well known
> company.
Does anyone know a BIG NAME software product (compared with Microsoft,
Aldus, Adobe, Quark, Frame, ...) written by Eastman Kodak?
Does anyone know Atari software that is _really_ able to compete with (e.g.)
FrameMaker or Excel? (No, Calamus and KSpread defintely are not, even if

you consider different prices!)

To sum it up, I do not think Atari Corp. will survive the recession we're in now this way, telling "very soon" all the time.
It seems to me like Atari is counting beans while other companies develop and sell.

Regards, Markus.

5839. Wanted: Info on the Atari Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 00:52:37 UTC
From: yonerjp@brandonu.ca
Message-ID: <1992Nov22.185237.2828@brandonu.ca>
Source record: 214441

Greetings, Atarians!

I was wondering if someone could either post or mail (or both) me a copy of all known information about the new Atari Falcon? I am interested in specificiations (memory, drives, video), compatibility (will it primarily be an Atari ST machine, can it run MS-DOS software, etc.), and PRICE!!!

Thanks for your help!

Deanna

From: afonseca@terapin.com
Message-ID: <afonseca.2bqq@terapin.com>
Source record: 214596

Well I may be a Dreamer, but it takes Dreamers to get things done. I will support ATARI's effort for the Falcon, and I will watch closely how it works out.. If it doesn't, I guess I'll just have to be another IBM user. I have high hopes for ATARI, but I understand why you don't believe in any of ATARI's Promises.. Why should you? I guess I just have faith in ATARI, but in my mind, this is ATARI's last chance.. If it fails, I'll just be an IBM 386 user. It would be a shame though.. ATARI under the right leadership can be an awesome machine.. Under its current leadership, its up to us.

5842. OPERATION: A.C.T. NOW information reposted

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 01:57:42 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1epdqmINNfbk@usenet.INS.CWRU.Edu>
Source record: 214595

Due to requests, I'm reposting Operation: A.C.T. NOW information.

"OPERATION: A.C.T. NOW"

Atari Community Together Now

Campaign Organizers:

Len Stys, Mark Leair

Supported By:

The Cleveland Free-Net Atari SIG

"OPERATION: A.C.T. NOW" is a series of campaigns that will first help increase support for Atari ST and Falcon computers. If there is enough interest in Atari 8-Bit computers, the Portfolio palmtop, and the Lynx handheld video game system, this operation will support them as well. The main goal of this operation is to strengthen the Atari Community.

"A.C.T. NOW" stands for Atari Community Together Now. The campaign organizers believe that Atari users, developers, dealers, publications, and Atari's management must take action to save the Atari Community. Many people suggested that we forget about Atari's involvement. They claim that Atari Corporation will never participate in this operation, even if it will help the company greatly. They believe Atari's management doesn't care about the Atari Community.

If they are right, Atari Corporation will not be around much longer. The Atari Community is the company's only edge over other PC manufacturers. We can only hope that Atari's management realizes the importance of this operation.

The organization of "OPERATION: A.C.T. NOW" was no easy task. Many things needed to be considered such as who this operation should benefit. Should it benefit Atari users or Atari Corporation? We also didn't know if it should be run in a positive or negative manner. And if it should be "anti-Atari" or "pro-Atari." We decided that this operation should be run in the most positive manner possible. This is because nothing positive ever results from being negative. We also decided that it should benefit ever member of the Atari Community equally. This is the only way the operation will be able to strengthen the Atari Community. And lastly, we decided that this operation should not be "anti-Atari" or "pro-Atari", but "pro-Atari Community."

The first campaign in this operation will give you the opportunity to tell Atari's management everything that you feel the company is doing

right and the things that you believe the company can improve. This campaign will benefit everyone in the Atari Community because Atari Corporation will become stronger by the information that you provide them. And when a member of the Atari Community becomes stronger, the Atari Community becomes stronger.

The second campaign will ask publications to publish articles about Atari's new Falcon030 personal media computer. How will publicity help the Atari Community? Atari dealers will sell more computers, Atari Corporation will sell more computers, Atari developers will sell more products, publishers will have more readers, and Atari users will have more products to purchase and fellow users to talk with. We will also be speaking out for what is fair. Atari announces the new Falcon030 computer at the Boston Computer Society meeting and the nation ignores the company. Apple announces new computers every other week and every major newspaper and computer magazine in the nation publishes an article on them. This is not right. As members of the Atari Community, we need to stick up for each other.

There will be many other campaigns that will directly benefit Atari users, developers, dealers, and publications as the first campaign benefits Atari Corporation. But, every campaign will benefit the Atari Community. If you are interested in strengthening the Atari Community, join us... We can make a difference!

Sincerely,

Len Stys
Mark Leair

Cost?

There is no cost to you in any way to participate in these campaigns. There is no registration fee and no donations are being accepted.

Members Key to Success

The number of people participating in these campaigns are extremely important. We can accomplish anything together. The news of these campaigns must be shared with every member of the Atari Community that you know. "OPERATION: A.C.T. NOW" should be publicized in Atari publications, at Atari user group meetings, Atari shows, and Atari dealerships. If you take action, we can and we will make a difference. If you sit back and watch, we won't do anything.

Official Site

The Cleveland Free-Net Atari SIG is the official site of "OPERATION: A.C.T. NOW". If you wish to add any information or discuss anything related to this operation, a special section has been created specifically

for this purpose on Free-Net.

The Atari SIG can be accessed by the phone number "216/368-3888" at either 300, 1200, or 2400 baud. It can also be accessed by users from around the nation or world for free by using "telnet" at their college or business by the following Internet addresses:

freenet-in-{a,b,c}.cwru.edu = hela.ins.cwru.edu = 129.22.8.38

Type 'go atari' at any menu.

The Cleveland Free-Net Atari SIG's U.S. mailing address is:

Cleveland Free-Net Atari SIG
P.O. Box 364
Mentor, OH 44061-0364

The Cleveland Free-Net Atari SIG's Internet e-mail address is:

xx004@cleveland.Freenet.Edu

Online Newsletter

There will be an "OPERATION: A.C.T. NOW" online newsletter to keep members informed about what is going on.

A.C.T. NOW Directors

If you are interested in becoming an organizer of "OPERATION: A.C.T. NOW", please contact us by the address above. We are interested in having several people from each group of the Atari Community direct this operation.

Independent Operation

"OPERATION: A.C.T. NOW" is in no way affiliated with Atari Corporation. These campaigns are organized by individuals that have an interest in Atari products. The "Atari" name, logo, and any other Atari products mentioned are copyrighted by Atari Corporation.

"OPERATION: A.C.T. NOW" is supported by the Cleveland Free-Net Atari SIG, but individual SysOps and members may or may not endorse this operation.

+------------------+
| CAMPAIGN ONE |
+------------------+

The first campaign will be to compile two lists. One list will consist of things that we believe the company is doing right. Atari is doing great things and if you want to continue seeing the company doing these things, you have to let them know. The other list will consist of things that we believe the company can do better. The company will never

know the problems that you see unless you tell them. We will send these lists to Atari Corporation's Board of Directors and ask that they consider our suggestions. Will Atari listen? There isn't a successful company around that doesn't listen--especially to their customers, developers, dealers, and publications.

What you need to do is write down everything that you see right with Atari and the things that you believe the company can improve. Include any past experiences that you have had with the company.

Here are a few examples:

RIGHT IMPROVE
Users
----- Great products, No easy memory
great price upgrade

Once took 4 months
to get my computer
replaced when sent
to Atari

Developers
---------- Good developers Took 3 months to
area on GEnie get a computer to
develop on

Great computers Atari was rude to
to develop on me when they first
showed me the Falcon

Dealers
------- Good dealer Shortage of products,
support even today

No new products

No co-op advertising
and lack of company
advertising
Publishers
---------- Atari advertises Slow to pay for ads
regularly

Does not give enough
new info to us

The comments made in these examples should not be taken as truth. They are simply examples. Also, your comments can be as long as you want. In fact, the longer and more detailed, the better.

If you wish to remain anonymous, you may send these lists in another envelope.

The goal of this campaign is to inform Atari of things that we believe can help improve the company's position in the computer marketplace.

All of the lists that are received will be compiled and then sent to Atari Corporation.

```
+------------------+
| CAMPAIGN TWO |
+------------------+
```

The second campaign is to concentrate on letting computer publications know that Atari is back.

The Falcon030 has been released in the United States. The amount of press that the Falcon receives will most likely determine when the Falcon will be shipped to the United States and the quantity shipped.

The Boston Computer Society meeting was not as successful as it should have been. This is because there was little press covering the Falcon030 announcement.

What you need to do is list names and addresses of publications that you wish to see have an article about the Falcon030 personal integrated media computer. The campaign organizers will compile everyone's lists into a larger list for everyone to write these publications. At the same time, we will contact Atari Corporation so the company can make arrangements with these publications to see the Falcon030. The one thing that Atari needs is press and this is probably the best way to get press.

You should also list names and addresses of publications that you wish to see support the Atari ST and Falcon computers on a continued basis.

This information should be sent along with the "OPERATION: A.C.T. NOW" registration form.

OTHER CAMPAIGNS WILL BE ANNOUNCED
AT ANOTHER TIME

THESE MAY INCLUDE:

8-BIT, LYNX, AND PORTFOLIO
CAMPAIGNS

THANK YOU AND PLEASE SEND THE

W> method (or, more accurately, a SHORTER method, as that way would increase
W> the filesize by almost 1k - and something as simple as this program should
W> not be too big!

Try this. It _should_ work....

~FSETDTA(BASEPAGE+128) ! set Data Transfer Address
e%=FSFIRST("TDSS_1_2.PRG",1) ! What and where to search (default dir)
DO UNTIL e%
d%=DPEEK(BASEPAGE+152)
d$=" "+RIGHT$("0"+STR$(d%/32 AND 15),2)+"/" ! month
d$=d$+RIGHT$("0"+STR$(d% AND 31),2)+"/" ! day of month
d$=d$+STR$(d% DIV 512+1980) ! year
'
t%=DPEEK(BASEPAGE+150)
t$=" "+RIGHT$("0"+STR$(t% DIV 2048),2)+":" ! hour
t$=t$+RIGHT$("0"+STR$(t% DIV 32 AND 63),2)+":" ! minute
t$=t$+RIGHT$("0"+STR$(t%+t% AND 63),2) ! seconds
'
e%=FSNEXT()
LOOP

The above works here, but double-check the code as I typed in the code from an
old set of notes. You may want to use the GEMDOS calls instead of FSETDTA,
FSFIRST and FSNEXT which are 26, 78 and 78 respectivly. If the FSFIRST call
results in a -33 then the program isn't there.

GEMDOS 87 (fdatime) does the 'TOUCH' command, and you may want to use that
instead since it can both read and write the file date and time info.

Atari has changed TOS development compilers to Lattice C and they are currently busy rewriting TOS for compilation with Lattice C. Also, the latest PC GEM version actually has LESS features than GEMTOS. There's no lawsuit keeping Atari from updating GEM in their machines and they've bought the right to make unlimited copies of GEM from DRI/Novell, so Atari can do whatever the hell they want with GEM on their machines, pretty much.

No,
Atari invested some money in the Amiga's development before Commodore took them in. That's Atari, Inc., by the way. When Jack Tramiel bought Atari from Warner, they weren't interested in the Amiga. Anyway, since Atari paid for part of the Amiga's development, they contended in court that they were entitled compensation for it. I can't remember if it was settled out of court or not, but for quite some time Commodore had to pay Atari a specified amount for every Amiga sold (until Commodore redesigned it, that is). Since Atari and Commodore agreed not to comment publicly on the settlement, we probably won't know the specifics of the deal, though.

No, the Falcon030 has
surface-mounted chips, which are a bitch (even for someone who KNOWS what
their doing) to fiddle around with. At first, Jim Allen said that even a
68030 accelerator for the F030 might not be possible, but now he thinks it
can be done. We just jave to wait and see.

Hello--

Can someone send me some tech specs and works in progress regarding the Falcon? I'm kinda curious...also I heard that there will be a 68040 version--is that true? Will there be some sort of connection that will alllow people to use their Falcons as videophones (I read that somewhere). Finally, can someone send me the retail and street price of typical Falcon setups? I would appreciate it.

Thanks again.

George Robbins (from Commodore, how 'bout that. Nice guy, really.) just posted the specs in comp.sys.atari.st.tech. List price for a 1MB machine with no internal hard drive is supposed to be around $799.

>I'm kinda curious...also I heard that there will be a 68040 version--is that
>true? Will there be some sort of connection that will alllow people to use

I've heard a fair amount about a 68040 version, but it's not going to be available any time soon. I wouldn't expect to see it in the next 3 months, anyway.

Hm, videophone, interesting idea, but not something we can do over the current phone network, is it? I've seen some AT&T blurbs about videophone technology, using some new compression scheme and only sending something like 10 frames per second, very low rez. Maybe that's over the existing phone network, but I think it's targeted at a digital optical network... I guess it's a cool idea but I don't think its time has come yet. (Besides, I'm more often thankful that the other end *can't* see me than I'm wishful about seeing the other end. Must be all those callers waking me out of a sound sleep... }-)

You can do better than that, just get yourself a SCSI cable with 3 or more
connectors on it. Then you can have the "interface" ("host adapter") as well
as the 20 MB drive *and* the Syquest connected all at once. The "drive with
embedded controller" is definitely a SCSI drive....

Hi!

Everybody's talking about 21Meg flopticals but in the ads I've seen so far,
the flopticals are compared to 1Meg and 2Meg discs which is, of course,
unformatted capacity.
So can anybody tell me if you can use 21MBytes of a floptical or just about
70% of that?

Stefan

>value they are as they have been painted over.) This makes me quite angry.

Hi Robert,

I had the same problem as you. The thing is that you must remove
those resistors. They are 0-Ohms and the oly reason they are used
is that they are cheaper than real jumpers.
The old ROMs have a very strange pinout, with no --OE and adress pins where
they should not be.

Just desolder them from you mainboard. Then you might want to
put in jumpers (that's what I did ;-)).

The soldering should not affect your mainboard if you're carefull
with it.

And besides, TOS 2.06 is worth it.

Bye,
Thorsten

:
: (Probably been archived with the Un*x version)

I don't think this is quite correct. Lharc uses the lh0 or lh1 compression methods and puts a ".lzh" file extension.

LhA uses lh4 or lh5 compression (tighter giving greating compression) and uses the ".lha" extension.

At least this is how it works on Unix and Amiga. The Atari ST verions of Lharc might be different, but I don't think so...

lynbech@daimi.aau.dk (Christian Lynbech) writes:

>There is not cathes to that about 9-bit SIMM's ? They can just be plugged in,
>or must one disable the 9 bit explicitly ?

I bought my SIMMs and they work. My configuration is:

bank 1 2x1 meg 80ns 8 bits (8x1mbit)
bank 2 2x1 meg 70ns 9 bits (3x3mbit)

conclusion: any combination of anything will work. The 9 bit chips are cheaper
than the 8 bits anyway. Still it feels a bit strange to have 256K in your
computer that's just there for nothing (or for IBM, in a way, but what's the
difference).

5857. Another clown who can't get Chaos to work

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 09:11:13 UTC
From: hjb@levi.th.vu.nl
Message-ID: <1992Nov23.091113.10182@cca.vu.nl>
Source record: 214407

After all the lively discussions about Chaos being
either the best game ever or the ultimate pits, I
decided to look for myself. So I picked up a copy
from atari.archive.umich.edu, formatted the
ridiculously large disk (:-), unmsa'd the whole thing
and sure enough: I now have an auto file containing
a loader and chaos.prg. BUT...: When I try to run
the program, it enters a loop, rebooting & telling me
time and again that this boot sector is virus-free.
Now that is great news, of course, but I would like
to see something more happening after a while.
BTW this same thing happened when I tried to run
chaos.prg without the loader, after booting with
another disk.
It even happens with both files outside the AUTO
folder, so it is not simply a matter of crash and
reboot.

Does anybody have any bright ideas about where the
cause of my misery lies?
- is this virus check part of the loader? Is it
included in the msa disk image, or has some other
program (fcopyiii, for instance) put it on there?
- why would even running chaos.prg directly result
in this virus check routine?

thanks,
Hendrik Jan Bosman

>All true wisdom is conveyed in one-line witticisms.

The system you are talking of does indeed work on an ordinary phone line,
and will be in sale in Britain in the new year. The company which developed
the phone is Plessey.

The it compresses the data by only sending the differences between pictures,
rather like the video conferencing technology. The frame rate is VERY low,
something like 5 frames per second and it is quite low res.

I'm very sure that the Falcon's hardware could easily cope with the data,
and what with the video phone costing initially about 400 pounds, it
wouldn't be THAT much more of an expensive solution, assuming that the phone
interface could get BABT (the British phone testing agency) approval.

Hello!

In the newest package of Crack Art (V 1.34 TT+) english docs are included.
There also exists an extra english-doc. You can get the both via anonymous-
FTP from ftp.tu-clausthal.de (139.174.1.3)
/pub/atari/graphics/painter/crackart.lzh
/pub/atari/graphics/painter/ckartdoc.lzh (english doc to V1.0)
Hope this helps...

Bye,
Wolfgang.

5863. Falcon delivery date!

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 11:40:34 UTC
From: kgrubb@cs.hw.ac.uk
Message-ID: <1992Nov23.114034.25385@cs.hw.ac.uk>
Source record: 214414

There has been a lot of talk about when the Falcon will be delivered to shops for sale. There has been numerous people spreading rummors about the Falcon, without hard evidence.

Atari have not said anything on paper (I think). Well, I have seen with my own eyes a fax sent from Atari's U.K distributor that they will deliver a number of 4Mb Falcons on 25/11/92!! And my ordered Falcon is on this delivery!

But I suppose I'd better not get too excited, I'll belive it when the cash has parted from my hand, and I have a Falcon instead. But I think it is the first hard proof? Does anyone else know of a similar delivery date? I'll let you all know on Wednesday if I get one or not.

(I know I'm late following up to this but news takes about two weeks to get to
us. Bother. I greatly prefer direct e-mail for bug reports.)

Julian Reschke tells me that the program file header in the distributed
ASCREEN 3.2 isn't set up correctly. Apparently this is because I still use a
slightly outdated Turbo C linker (it seems that it *is* time to upgrade, after
all).

Anyways, it looks as if the program erroneously professes to have a sharable
text segment. I'm told that this can be fixed using toglcr.ttp. I'll have to
try that for myself, though, since I don't use MiNT regularly.

Perhaps it should be in the FAQ list?

TOS ROMS

ATARI STE (Tos 1.6, 1.62, 2.06)
These have 32 pin I/C holders.

My 1.6 and 2.06 tos versions were both the same type (32 pin type 27C010A)
Here follows the jumper settings for other ROM/EPROM types:
From the STE Computer Field Service Manual (C302481-001 REV A Aug 91)

ROM Jumper settings:

ROM/EPROM Part type W102 W103 W104
27256 Don't care 1 and 2 N/C
27512 2 and 3 2 and 3 N/C
571001/27C1000/531000 2 and 3 2 and 3 2 and 3 (the default setting)
27010/571000/27C1001 1 and 2 2 and 3 1 and 2

The jumpers are located next to the HI eprom

W104 W103
1-2-3 1-2-3

----------------. W102
1 | 1-2-3
|
-

> in the first place.

The 68020 and 68030 both have a feature called Dynamic Bus Sizing. This means that instead of a single DTACK to acknowledge the bus cycle, there is a pair of DSACK lines - DSACK0 and DSACK1. When the CPU wants to do a longword (32-bit) access, it places the data on all 32 data lines. The address decoding then determines whether the addressed device or memory can listen to all 32 or just 16 or 8. It then responds to the bus cycle with some combination of the DSACK lines to indicate whether 32, 16 or 8 bits of data have been accepted. In the case of 32 the access is complete. Otherwise the data gets shifted over so the unaccepted part is on the part of the data bus that the accepted part was on, and another bus cycle is run. This keeps happening until all the data has been accepted (i.e. twice for a 16-bit port, and four times for an 8-bit port). Since the address decoding decides which DSACK lines will be used to acknowledge the cycle, it can have different addresses with different bus widths, e.g. 8-bit peripherals, 16-bit ROM, 32-bit RAM, etc.

The 68008, 68000, 68010 and 68070 don't have this facility, and neither does the 68040 (don't ask me why!).

Tony.

Hiya all,

I've been using Flash for quite a few years now, and I ust want to know what improvements Flash II would offer.... Is it basically Flash with some extra features built in (if so, what are the new things)? Or is it a totally different program (and if so, what is it)?

Basica;;y I'm really interested in the 'command language' (I'd really need conditional branching) and some multitasking (background operations, etc). Is the capture buffer set up the same/similar (I love it.. :)) ?? Thanks a lot.

Damian

P.s. This question was probably answered in the past, so just email me your comments to save bandwidth - I'll post a summary, in case someone else might be also interested. Thanks.

Yesterday, I had a disaster on my hard disk.
I renamed an accessary fomr .ACX to .ACC and then rebooted to install it
but unfortunately I my hard disk hadn't finish doing it.
Subsequently 8 root directories and a few files where lost, gone, dead!!!!!
My drive C is partitioned for 20meg.
I've heard that the commercial program knife ST may help me but I'm not sure?
If not is there anything that will ???
I havn't written to it in the hope that one day everything will be
normal again.

Somewhere in a gray past I remember words on the Falcon being designed
to cope with different clock frequencies, i.e. just pop out the quartz
and the CPU and put in faster ones. I found this unbelievable back
then (designing frequency-independent motherboards is not trivial,
especially when high frequencies (like 50 MHz) are involved).
Apparently Atari dropped that idea. Too bad.

Source record: 214428

To add to Stephen Usher's posting:

I saw a demonstration by British Telecom of a videophone operating over standard 64kb/s phone network bandwidth. The frame rate was variable depending on how much of the picture was changing - thus giving about 12+ frames per second if only your mouth was moving. It had some wickedly impressive signal processing that not just decoded image differences, but would track objects and just transmit their outlines and new positions. The penalty was that the processing took so long that the lip sync was quite dreadful. This may well have improved as it was only a prototype model.

It's quite remarkable to think that you might be able to use a relatively cheap home computer as a videophone.. imagine suggesting that 10 years ago to a Sinclair ZX81 owner!

Richard Thomas

5877. Ideas for new MiNT/MultiTOS specific Desktop replacement, PLEASE.

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 16:35:19 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.722536519@oxygen.sys.uea.ac.uk>
Source record: 214431

OK, as the tite suggests, I'd like ideas, suggestions etc. for a
MiNT/MultiTOS Desktop replacement.
I have already written the core of a replacement Desktop which so
far has pretty much the same functionality of the standard Desktop (as of
TOS 3.06). I'm currently looking at Gemini/Neodesk to look at the current
state of Atari Desktop's. I'm also trying to find out exactly what NewDesk
(probably tm or something) on the Falcon does or doesn't to.
I've already got quite a lot of nice ideas, some of which I will
mention, some of which I won't (got to protect your ideas, don't you know :-)).
I'm hoping to have a test version ready by approximately Christmas, but don't
quote me on that. I will release it as FREEWARE, possibly giving extra goodies
to financial contributors :-)
If you don't think I should carry on doing this because X is already
doing this but better or because Y, email me by all means... I'll probably
do it anyway just as a kind of exercise/experience trip. Besides, I'm stubborn.

OK, so far my features are (I'll probably forget some and some of
these may only be in a design or semi-implemented form but these
will hopefully all work in the finished program):

- Looks and feels (and smells :-)) like the Atari Desktop generally
- All of the features of the TT Desktop (as of TOS 3.06)
(i.e. customisable power-keys, reasonable configurability...)
- Requires MiNT/MultiTOS to run (OK this is a requirement !!!)
I decided that everbody should have one or the other and besides
it makes it much easier to write that way.
- Completely MiNT savvy (not MultiTOS yet... I'm not a developer)
Understands about processes/pipes/shared memory/file systems/
symbolic links etc
- Communicates with TOSWin i.e. allows you to automagically run a TOS
program in a TOSWin window (assuming it's running)
- File operations are run as separate processes, allowing multiple
move/copy/delete actions while still using the Desktop.
- Much more flexible installation of applications than the Atari
Desktop. Also allows installation of file types.
o Programs are installed with their path, an icon, the file
types which can be dragged onto it, a default flexible command
line.
o File types can be installed with a short description, their
icon, their type (program, text, accessory etc) and an action
to be performed when they are double-clicked... this is not
limited to simply launching an application with the file
passed as a parameter.
- User and auto customisable icons for different files or filetypes.
- Each file window individually customisable (mixed icon/text views,

user-placeable icons etc.) with saveable configuration.
- A mechanism for I/O redirection including piping of applications.
- Full use of the evironment system. Allows automatic initialisation
of environment at startup and full used editing of it.
- Uses Atari Extended Argument system (i.e. ARGV=? <args> in env)
- Extended item information system. File, folder and drive information
as before but special information given about pipes, devices, shm's
symbolic links etc.

Errm... that's all I can think of for now and besides I'm hungry.
Please send EMAIL to sms@sys.uea.ac.uk if you have anything to say and I'll
post a summary if there is enough interest.

I actually have LOTS more ideas but I kind of want to amaze (or at
least impress people... it's kind of trickky to amaze hardened netters :-))
everyone when I finish it...

Thanks in advance for any comments, ideas,
(financial contributions, offers of jobs after I finish my Ph.D. etc)

Steve.

P.S. Please don't ask for copies yet as it's still under very serious
development and I won't give anyone (except perhaps Atari :-)) a copy
until I'm fairly sure it's sound.

- Steve Sowerby, Postgraduate Layabout (sms@sys.uea.ac.uk)
- School of Information Systems, University of East Anglia, Norwich, England.

>of GFA Basic (sold seperately, although I think my version was PD).
>
>Can someone please help me out? Help Much appreciated!

I assume you are using the old version 2.0 of GFA BASIC? If your interpreter saves its files as *.BAS, it's the 1.0 or 2.0 verison. If it saves them as *.GFA, it's 3.07 or above.

Although the GFA BASIC 2.0 interpreter was placed into the public domain some time ago, the compiler for 2.0 remains commercial software, not P.D. It is available in the US directly from GFA Software Technologies, 27 Congress Street, Salem, Massachusetts or by calling 1-800-766-6GFA.

Word of advice... if you are trying to do anything in GFA, go ahead and spring for the upgrade to GFA 3.5 with full documentation. It is light years ahead of the old 2.0 version and well worth the upgrade fee. Or you might hold off for the "imminent" release of version 3.7 which promises full Falcon/MultiTOS compatability, new GEM based editor and other goodies.

5884. Pure Pascal For the ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 18:48:43 UTC
From: rahin@scs.leeds.ac.uk
Message-ID: <1992Nov23.184843.21128@lut.ac.uk>
Source record: 214398

About an week ago I downloaded a demo for the Pure Pascal compiler from a German FTP site. The only thing I could understood from my very limited knowledge of German is that it is compatible with Borland's Turbo Pascal 6.0. The product seems to be a good one and has an integrated debugging facility as as well as an Object Browser, something like Borland C++ 3.1.

Can any German ST user on the net enlighten us as to it's availability ?

- Rahin

> I was at my friends last night, and he has
>CyberPaint and Cad 3D. These both look like pretty good programs,
>but I can't find them in any catalog. Have they gone away?

The software company which produced CAD 3D and CyberPaint is no longer in
business. They were connected with the magazine people who published STart
and Antic.

However, if you're prepared to wait for a few months to collect the programs,
you can obtain CAD 3D and CyberPaint through the UK magazine 'ST Review'. They
will be including these on their cover disks over the next several months ---
at least that is what the advert in the current issue indicates.

About the only program that is likely to restore your HD without a LOT of work (which doing so with Knife ST requires). Is 'Diamond Back' (or at least - it sounds like it can). Unfortunately, it costs a lot of money. (around $65US from memory)

Chkdsk3 might be able to do it, if all that's been done is corrupted the FAT's. (Knife ST will do this quickly too!)

Current Notes (November 1992) has info about Macintosh ST Connection, a program sold by CompuSeller West. Does anybody have this program? How is it?

It works. I think the human interface is real tacky. It uses a custom scrolling text region and it does not function like a file selector dialog. Also, you cannot select groups of files to transfer (no multiple selections.)

Again, it does work. Since it is version 1, I hope to see improvements soon.

I'm not sure if this was in your list, but:

-priority settings via a "file settings" box (something similar to the Settings option on a DOS window in Windows (gives the options for: foreground priority, background priority, exclusive/background running)

-running ANY program (say ARC Shell) in a Window or full screen (again a la Windows 3.1)

just my 2 cents...

>
>I'm not sure what you meant by "sub #1000 PC". Is that 1000 dollars or 1000 pounds?

Sorry, I realised yesterday that this was ambigious (you know what I mean) - I meant 1000 pounds.

>Right now you can buy 25 Mhz 486SX machine for under $1000, and that will give
>you roughly 8 Mhz 68000 emulation. You can still use the real Quick ST or Warp 9

Today I saw a 25MHz 486SX with VGA Colour monitor and software for 999 pounds inclusive, so I guess either way I'm wrong now!

>running on Gemulator to give you the kind of speed ups you get on a real ST,
>since Quick ST does things in less code, Gemulator has to emulate less code and
>thus speeds up. Same reason it speeds up a real 68000.

Ever thought of implementing some kind of "cache" of the most recent 386 code you have converted from 68000? At a simple level you could keep a record of the 386 translations for the last 100 68000 instructions executed and if you came across a backward branch instruction you could jump back into proper 386 code - this would speed up loops in a big way.
Since most 386 machines have caches, there should be no self-modifying code to f things up.

bossoj@aix.rpi.edu (Joseph Charles Bossolini) writes:

> I just downloaded a copy of Winx in hopes of using it to patch
>my TOS 1.4 to be able to use more than 8 windows. Unfortuanately,
>I don't understand German, and I cannot make heads or tails of the
>instructions!! My question is: What do I have to do to patch
>my TOS 1.4 (they are ROMS)? Do I have to create a new file with
>Winx and then burnthem into a new set of Eproms?

>Any help would be greatly appreciated!

To take full advantage of WINX, you do *not* need to burn new EPROMs! It
just saves booting time and memory!

Simply put WINX.PRG in your AUTO folder and the WINX.CPX in your CPX
folder and reboot. Call the CPX in order to make your settings, then
click the 'Sichern'-button. There is no 'OK' Button because changes will be
made after your next reboot. (Abbruch=Cancel)

I read the manual a long time ago, so I don't know if there will be
problems with non-German ROM Versions. If you are *really* interested in
WINX, I could send you the patched 1.4 ROM file produced by WINX. For me
it would be no problem using an English OS, but maybe it would be a
problem for you using a German one?!

I use WINX with TOS 2.06 in my MEGA ST. I have to copy the GEM into RAM
first (using GEMRAM from the WINX author). After that WINX can patch the
GEM.

But: You will never get more than 7 windows on your desktop! Only
applications or alternative desktops (e.g. Gemini) can make usage of the
more windows! Gemini has some problems with WINX, if you scroll a
window, that is not active and laying particulary under another one. :-(

But there will be a new (MiNT supporting) version of Gemini, soon. Let's
hope this small bug will be fixed!

>Joe (bossoj@rpi.edu)

I just subscribed to this group for the first time and found all
these postings reminiscing about the good ol' days. What is
happening with Atari now? Are they coming out with any new
computers? I haven't seen anything new from them in years.
I remember back about 6 (?) years ago when the ST and Amiga
were coming out, my friend and I would always argue about the
two machines. He tried to argue about how great the ST
was, while I tried to explain how he had an inferiority
complex since the Amiga was so much better.
But anyway, neither machine seemed to do as well as some
predicted. I know Commodore is still doing Amiga-stuff,
what's Atari up to?

BT have a Videophone on the market (for about 500 pounds I think). You are
correct in saying that it uses advanced compression and the frame rate looked
like about 5 per second when they showed it on the News at 10. Apparently
they are selling it abroad. I think GPT manufacture it.

5897. ST Format

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 22:39:34 UTC
From: leo@dcs.warwick.ac.uk
Message-ID: <1992Nov23.223934.29672@dcs.warwick.ac.uk>
Source record: 214447

Lots of people seem to be complaining about how crap ST Format is, so I thought I'd post everything interesting in the current issue to save people having to buy it (I bought it for the free copy of Protext V4.3, without dictionary or manual (Available for 20 pounds), but otherwise complete).

Firstly they said that they have been told that a ship load of Falcons was just about to be sent to England as they went to press.
2. They have done some compatability tests with the Falcon030 and apparently no game that attempts to access the STs sound chip directly will work (I assume a crash due to invalid memory access). They suggested that this might be solved in the future. A few serious software packages also failed (including First Word Plus and That's Write) although scanner hardware and software worked perfectly. They said they were generally disappointed with compatability.
3. They showed the insides of a Falcon030 - from what I can remember every chip was surface mounted. TOS is stored on a single chip (Can't remember whether surface mounted). The general board design seemed a bit strange with several very long tracks on the upper side.
4. TOS4 is said to look like earlier versions (They did not have Multi-TOS) except that it has been 3Derised. They couldn't find any bugs in TOS.
5. They claim that a redesigned Falcon030 case will be out after christmas and an 040 machine later in the year.
6. They reported several interesting pieces of software being developed for the Falcon, mostly serious stuff by well known companies.
7. The DSP has 96K words (500K bytes odd?) of zero-wait state RAM - that's 32MHz speed (on a 48 bit data bus?)! (I already knew this really, but it never sunk in how fast and big the private RAM was before).
8. All that Falcon stuff has made me forget what else was in there.
9. Oh yeah, the rest of the news section was taken up by moaning about lack of ST games support (They may have a point - they could only find 4 or 5 games to review in that issue, I remember when they had 15 or so, not that I liked having to skip through that many pages of game reviews).
10.I just couldn't resist making it up to 10

>>First suggestion: do NOT get GNU C/C++ to learn about C programming...

> atari/Languages/sozo133i.zoo

Not meaning to start The War of the Compilers, but I thought Sozobon wasn't
even an ANSI C compiler. Anyone learning C would GREATLY benefit from the
extra protection provided by ANSI C.

In fact, I find the extra protection provided by C++ even more advantageous
for new users (although they don't HAVE to use the C++ extensions if they
don't want to).

IMO, the only difficult part about GCC is that it can be difficult to
install, since it is so large. But the original poster has a hard drive,
so there's no big hassle.

5900. Corrupted FATs

Newsgroup: comp.sys.atari.st
Date: 1992-11-23 23:41:47 UTC
From: smackiew@nyx.cs.du.edu
Message-ID: <1992Nov23.234147.17675@mnemosyne.cs.du.edu>
Source record: 214450

I'm a little new to this, myself, but whoever had the HD FAT problem...
are BOTH of them corrupt?
Also, a little bias here, you can force a read of the second fat
with Blitzschnell (ver.1.4U +up), though I don't know if it will change
the first to read like the second. I'll find out, though.

Best of luck with it, anyway.

Message-ID: <1992Nov24.024853.25420@mnemosyne.cs.du.edu>
Source record: 214353

Ok, if both fats are not messed up, you can use Blitzschnell to force a read of the second one, and then do a small cluster move, which should rewrite both fats correctly. However, if they aren't both messed up, the desktop should automatically use the second anyway...
(The above info given to me by someone else..)
Good luck.

Yes i have done it, but I would not recommend it to you as you do not
seem to be aware of the problem.
A CGA monitor is TTL input, an Atari computer is Analog output. You need
to make an analog to digital converter to connect them. There was a
circuit published in Elector a few years ago to do this, but I found it
needed extensive modification to be acceptable. Overall it was not worth
the effort. I now use a multisync, but that's another story. The sound
output on the Atari will not drive a speaker directly. Use an amplified
speaker of the type available for
walkmans.

Just a couple of comments on the mindless dribble that has been posted by a certain person (claiming not to be an Atari basher).

Item one, this person asserts that no game machine with a twelve button keypad was ever succesful. Hmm.... Ever heard of the ColecoVision? Thought you did. Yes I know that they went caput after the ADAM fiasco and investing ALL of their money in Cabbage Patch dolls. This does not change the fact that the ColecoVision was an tremendously succesful machine.

There was also a question about what the first console game machine was. If by this you mean something that took cartridges, I believe it was the Coleco Tristar. A great little machine, it was shaped liked a big triangle with a steering wheel and shifter controller on one side, a pair of paddle controllers one a second side, and a light gun and holster on the third side. I believe that there were about four or five carts made for it, each with several games. None of the games were much more complex than pong. Anyone else remember this beast? The next major machine (aside from Atari's fine product, which only a couple of years ago could still be purchased at KAY-BEE toy stores, they even had some 7800's) was, I guess , the Oddessy II. Anyone remember the assembler programming cart on THIS beauty? Around the end of it's life span, it even had a voice synthesis module.

Granted it is old, but like the man who replied before, I have an old Mega ST4 and it _STILL_ does _MORE_ than everything I could ever want it to do. PC compatibles and their software I've been exposed to (at school and friends--not including games) make me wanna barf. The Mac and it's software is nice and slick, but most of it's users I've met make me wanna barf. (The Mac systems seem pretty pricey too.) I guess my point is that the whole bigger-is-better philosophy that IBM has managed to plague the whole computer worl with hasn't seemed to make my word processor any worse or made me want one that's any better. It ain't broke so I'm probably not gonnaa fix it. (Unless I can find a REALLY good price on a FALCON -- I'm not sure how long the Mega will last -- phisically. It's been AROUND the block a few times.)

> YUCK? How many Nintendos, Super NES, and Genesis systems have been sold
> with joypads?

Probably about the same number whose user have said, "This controller sucks!" *8-)

Although I do agree that Atari's marketing a 12-button keypad thing is a mistake--if it's anything like the one they used for ColecoVision it'll be WAY too clumsy to use. They REALLY should've gone leading edge and produced something that could be really functionl for games and produced a copy of the Joystick set-up for StreetFighter II in the arcade -- full arcade-quality joystick and buttons.

5909. Megas/1040 st motherboards, inquiry?

Newsgroup: comp.sys.atari.st
Date: 1992-11-24 06:02:19 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Nov24.010219.1@vaxc.stevens-tech.edu>
Source record: 214360
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

It seems that the only viable solution to getting enhanced graphics in my ST tower system is to replace my 1040ST motherboard with one from an old Mega, thus giving me a MegaBus expansion slot. This seems like a good option but the tower case I have is manufactured by a German company called LightHouse and it is designed for a 1040/520.

Does anyone out there know how the 1040ST motherboard compares with the Mega ST motherboard? Some key questions,

1. Are the external (rear) connectors of a 1040 and a Mega in the same locations on the motherboard.

2. Are the two motherboards the same size.

3. Does a Mega motherboard have the same plug in connector on it for its keyboard that the 1040 has. On the motherboard of a 1040 there is a small connector that consists of a number of pins sticking staight out of the motherboard vertically, that a keyboard cable pushes down on.

Many thanks,
Scott Kolodzieski.

Hi Joe,

You don't have to patch Your TOS, just put the WINX.PRG in the AUTO-folder
and reboot, that's all. If You have a neuer version of WINX (>=2.00) You'll
even get a CPX to configure it and it runs with other TOS Versions like
3.06 (TT).

5912. ST-Review

Newsgroup: comp.sys.atari.st
Date: 1992-11-24 07:55:26 UTC
From: grillo@flash.ATC.Olivetti.Com
Message-ID: <57075@olivea.atc.olivetti.com>
Source record: 214361

Can anyone forward me the Address/Fax number of the UK magazine ST-Review ?
Opinion on that magazine are welcome. I'm currently subscribed to ST-Format
but I find it a little game oriented, so I'm looking for something more serious
I know that probably the best ST mags are Germans but I don't know that language

Savino.

Well from what I have been reading in GEnie Lamp and ST-Report, there will be very little software for the Falcon, thet stated there will be about 10 pieces ,(2 Grames) when the Machine comes out in March next year, also most of the software will be from Atari, or contracted out by Atari, there is very little instrest by software houses, also you will not be seing much to do with the Falcon till December 1993..

So go read the lastest GEnie Lamp and ST-Report..

I can't see any major software house supporting Atari with there record of droping things..

Would you like the list , its a bit long..!!

Its like betting on a horse and find that Atari has cut one of its legs off..

It also stated that Atari hope to sell some 10,000 machines by December 92, but Commodore reckon they will sell some 30,000 of the A1200 that is all ready out..

So I don't think I will be putting my money on the 3 legged horse,
gee Atari might even cut one of the other legs off...

>SDMR

I think that Atari uses both of the Fats, I did have a problem once, but ST-Knife stated that one of the Fats was different, ST-Knife can be set for one Fat, and to copy one Fat into the other....

I did find a Big problem with ST-Knife , you can't trace the clusters in a folder..

ICD's CleanUP is good for fixing Hard Disk problems...

>was wrong. Is there some other good back-up (public domain or shareware)
>program for which this feature is available?

Try backupst. It is quite fast, uses all available space on floppies
and splits files. It should be capable of doing incremental backups
as well (I never tested that). It does not do compression (but you
did that already). There's just that bug with not hiding the mouse
pointer...

Hint: if you want to compress even more than with arc you might
try zoo or lharc as well.

Just to continue the STF slagging, here's my thruppence's worth:

I won a SUpercharger 286 emulator from an STF competition. Unfortunately, the company who produced these never got them working and went bust. So did STF contact me to tel me? Did they hell. I contacted the then editor, Mark Higham, many times and he agreed to get some stuff sent to me, but was it sent? No. Finally, in July 1992, having won the prize in October 1991, I recieved the last part of my replacement prize, an SM144 monitoer (apparently only 1 of 2 knocking about the country at the time) So, if you want speed and efficiency, you know where to avoid.

Is this PC GEM shipped with DR DOS 6.0? I ran a program called TASKMAX
and got something very similar to an Atari desktop. Too bad it was so
bleeping SLOW or I might use it. Why is it slow compared to GEMTOS? Does
it have something to do with memory limitations? Hard drive "Windows"-like
disk swapping?

Sorry about this (somewhat) non-Atari posting to c.s.a.st.

adTHANKSvance,
Kenneth Love

5923. more than 4 GEM windows

Newsgroup: comp.sys.atari.st
Date: 1992-11-24 12:46:29 UTC
From: ea121@city.ac.uk
Message-ID: <ea121.722609189@Paddington>
Source record: 214376

Does anyone know of any routines available that I can incorporate into a program that I'm creating that will allow more than four windows. I am restricted to using the early version of TOS that will only allow four windows. I am assuming it is possible to some how patch GEM to allow more than four windows as it is possible on the later versions of TOS. These allow up to seven windows which would probably be adequate for my program.

Any help is welcome, be it a suggestion of a method that may make this possible or actual source code of a routine to do this, or even an executable program (with source code if poss)
that can be run from the Auto folder to patch GEM. Source code can be in any programming language but C is prefered most.

All messages to Paul Brewer, Email address ea121@uk.ac.city.

5924. Cheetah Copier problems

Newsgroup: comp.sys.atari.st
Date: 1992-11-24 12:49:44 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1992Nov24.124945@cs.bham.ac.uk>
Source record: 214375

Has anyone had problems using the Cheetah copier?
Last year I used an older version of it and it trashed my
D: drive (it took a week of FAT reorganisation to recover
75% of its contents.
Last week I got v3 from a.a and tried it. 10 minutes later
the directory contained files that looked suspiciously
like a file allocation table. I zeroed the drive - there
was nothing else for it.

Not happy. I wouldn't recommend this prog for writing anything
to a harddisk. Having said that, it ain't half fast!

Message-ID: <1992Nov24.145139.28075@gserv1.dl.ac.uk>
Source record: 214380

Hi Everyone ... (Sorry if this is a FAQ, I am new here)

If I understand the facts floating about regarding the Falcon
correctly it is about 5 times faster than the STE. How much
will this increase by if a 68882 is added.

Also how much faster is the STE than the standard old 512ST.
I'm just looking for round about speeds not benchmarks.

Thanks Gary

PS If anyone knows how many MIPS / SPECMARKS the Falcon + 68882
will run at I would like to know.

Thanks again for any help

Warwick Allison (warwick@cs.uq.oz.au) wrote:
: I have heard that a 16-bit bus attached to a 68030 is not as bad as
: I'd first thought. The 16-bit bus does not NECESSARILY cripple the
: architecture. I don't have the details, but apparently you can use
: a 16bit bus and multiplex it for upper and lower 16 bits.

OK, but it will cost you twice as much time, compared with a 32 bit
bus. This is why the 16 bits 030 Macs are that slow.

: Remember that the Quickindex figures showed the Falcon to be approx 50%
: of the speed of the TT for CPU-memory related tests (not 25%) - indicating
: that the Falcon does not suffer a 50% loss in speed from the 16-bit bus,
: or the TT is 16bit... or 16MHz :-).

I don't know too much about Atari stuff, but wasn't the TT originally
a 16 Mhz design, on which a 32 Mhz 030 was put? This may explain why
the speed is 50% of the TT (32 bits & 16 Mhz <-> 16 bits & 16 Mhz)
instead of 25% (32 bits & 32 Mhz <-> 16 bits & 16 Mhz).

Correct me if I'm wrong.

Peter.

Source record: 214385

> If I understand the facts floating about regarding the Falcon
> correctly it is about 5 times faster than the STE. How much
> will this increase by if a 68882 is added.

The 68882 will not help out any software that does not specifically
use it. Another problem is the floating point processors are accessed
differently on a 68000 vs 68020/68030. If Atari had made their
software floating point package readily available maybe we would
have software that could automatically take advantage to a floating
point processor.

If you do get software that is 68030/68882 compatible then the increase
in throughput depends upon how much the software package uses floating
point math.

> Also how much faster is the STE than the standard old 512ST.
> I'm just looking for round about speeds not benchmarks.

The ST and STe, not MegaSTe, are equivalent machines with regards to
CPU power.

> Thanks Gary

No problem.

> PS If anyone knows how many MIPS / SPECMARKS the Falcon + 68882
> will run at I would like to know.

Don't know exactly but I would guess the MIPS of a 16Mhz 68030 attached
to a 16 bit bus with 2 wait states would be somewhere in the 2.0->3.0 range.
(2.0 = both caches off, 3.0 = both caches on)

> Thanks again for any help

Again, no problem. Just hope this does not start a flame war, or useless
statements about memory being any MHz.

Amiga or Amiga corp., Lorraine was the name of the computer originally. And
they made joysticks, I have one! Jay Miner designed the custom graphics chips.
He also designed those of the Atari 8bits. He said that he designed the Amiga
because he wanted a better flight simulator. Mark..

>Also how much faster is the STE than the standard old 512ST.
>I'm just looking for round about speeds not benchmarks.

Gary, the STE is not actually any faster than the ST since they both use the same 8MHz 68000 processor. Granted, STE's may benefit from a newer TOS, blitter chip or other add-ons which help out. The MegaSTe uses a 16MHz 68000, of course.

The addition of an FPU such as the 68882 does not speed up a machine. It only helps crunch floating point math operations _if_ the software is written so as to address an FPU if one exists.

Also, the Falcon's speed is once again relative to the task at hand. But if people insist on a speed comparison based on generalities, try this:

TT = 2 x Falcon 030 = 2 x MegaSTe = 2 x ST (or STe)

This is _very_ simplistic (and unfair to the TT) but a fair rule of thumb. And really, let's NOT talk about MIPS as that is one absolutely useless indicator of performance, IMHO. What is is? "Mindless Information about Processor Speed" (or something like that). :)

Ouch you brought up some old memories with the assembler cart on the Odessey II and the membrane keyboard. I remember that as being a heck of a first foray into the 'programming' arena. I remember spending long hours on the one game that came out for it with a cloth map... was a adventure of some sorts, highly touted at the time if I remember correctly but for the life of me I can not remember its name!

Oh well... rehashing memories enough for today.

Having been to Disney's EPCOT centre last week, I saw the AT&T video phone in one of the displays (I forget which one). I talked to the AT&T guy there about it, and he'd never heard of the Plessy one, which suggests that the two phones were independently developed.

The AT&T man was reluctant to talk about data compression, but I believe the Plessy phone solves some of the problem by only transmitting the parts of the image that have changed from one frame to the next. I imagine that things would get jerky over a transatlantic link, but the demo was quite impressive. The screen was full colour active matrix LCD, but rather small -- I guess this is why the low resolution doesn't matter. The frame rate appeared to be well above 5 frames per second, but below the magic 25 frames per second.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can anyone help me get a hard disk drive I have recently acquired working.
The drive is a Micropolis 330Mb Half-height drive, Model no 1684-7
manufactured in 1988.

On the back of the hard disk drive is the power connection, the SCSI
connection and 12 jumper connections. On the circuit board by the
jumper connections are labelled:

<nothing> ID1 ID2 <nothing> TP3 <nothing> .... <P4>

The drive spins up OK but the ICD software doesn't recognise the drive
as being present on the bus at all - I know I have the SCSI cable in
the correct way around because the ICD clock is there OK.

The only instructions I have are for setting the SCSI address which involves
putting jumpers accross the first 3 connections in various combinations.
I've got no jumpers on so it should be SCSI ID 0. The drive does have the
terminating resistor pack in OK.

I have tried putting jumpers in the TP3 and 24 positions but the drive still
wasn't recognised.

I know the drive is OK because it used to work OK on a friends PC.

I suspect that I need to change the parity setting but I don't know which
one it is - any ideas or can someone give me contact details for Micropolis
(preferably in the UK)

AdvThanks

Geoffrey

5943. (IBM) 1.44 drives - am I silly or what??

Newsgroup: comp.sys.atari.st
Date: 1992-11-24 21:18:14 UTC
From: wsbusr3@rw6.urc.tue.nl
Message-ID: <wsbusr3.722639894@rw6.urc.tue.nl>
Source record: 214215

Hi ST - boys & girls,

I've got a major problem with my 1040ST's internal 720K drive.
It's broke.

It has rumour that most internal IBM-drives can replace it
effortless - with some modifications to the ST's cover that is.

So I tried a TEAC 1.44 (internal) drive.
Without a HD-kit an/or different controller it would act like a 720K-
drive, and I could always upgrade it later with a kit/controller.
So I'm told by several people.

<CLICK> ST ON
TEAC 1.44 drive starts spinning, yet fails to read my 720K bootfloppy.
After 30 sec's the dektop shows up anyhow.
The drive simply continues spinning !! (without reading anything.)
<CLICK> ST OFF
I tried the same with the big black connector upside-down
(as was the power-connector, so "who knows..", I figured)
The drive then didn't do a thing, though. (which was better than
exploding in my face, ofcourse).

QUESTIONS:

* My dealer offered me to try his Mitsumi 1.44 and Y-E-Data 1.44
drives as well. If they don't do the job,
I'll get a 80% refund :-(.
Will they be any good?
What brands usually would?

* Can a 1.44 plugged into the ST as is indeed perform like a 720K drive?

* The black connector is way to the right compared to my ST-drive.
Should I solve this with more flat-cable?
Are those cables available with pins on one end,
and holes on the other?
(otherwise I can't even build those drives in properly)

* These IBM-drives are also 1/2 an inch lower than the usual
internal ST-drive.
How does one normally go about building them in neatly?

Suggestions, shared experiences, solutions and sheer laughter
with respect to some, most or all of these 4 questions
please to this group or else to: at073@cleveland.freenet.edu

Thanks in advance!

Already regretting this IBM-drives circus,
cheers,

Rowdy Blokland,
The Netherlands.

```
l>i want to connect a CGA moniter to my 520ST. has anyone done this?
l>
l>there seems to be two points of concern:
l>
l>
l> 1. the plug is not common, it appears to be din. is there
l> a name for this type of plug? can anyone suggest sources?
l> it has 13 pins and is the same shell as din.

There is no easy way to connect a CGA monitor to an ST, since CGA is _digital_
RGB (signal levels 0V and 5V), whereas ST color signals are _analog_ RGB, with
voltages from 0V to 1V with 8 or 16 levels, depending on whether you have an
ST or STE.
You'd have to convert the analog signals to digital ones, thus convert 512/4096
colors to eight. Even if it could be done, screens will look quite strange.

So just forget it. I tried to do it about six years ago, and failed to achieve
a precise threshold for pixel on or off and sharp pixel edges.

Yes, there
will be a 68040-based Falcon, but it won't see production until at least late Spring or Summer '93, possibly not until Fall '93, though. There is a developer (or are developers) that are working on videophones for the Falcon, but they won't be ready for a few months yet.

5949. Re: Falcon delivery date!

Falcon030's STARTED shipping in
England (and maybe other European countries) just a few days ago (like
21/11/92-23/11/92 sometime), so they ARE selling to the public AT THIS TIME.
North American dealers are supposed to be receiving demo units within the
next week followed by 'real' shipments in mid-late December and into mid
January.

: I would like to send files of around 30~50Kbytes over a modem, what would be the best way to do this and what software should I use at both ends, Both systems are atari's but the modems differ. The max transfer rate is 9600 at one end.
:
: Craig

Once you get your modem program, you'll have to set the speed to the lowest speed. A 9600 baud modem connected to a 2400 baud modem won't transfer very well at 9600 baud, as the slower one will get lots of garbage and errors.

Regards,

Jim Fang

Scott Kolodzieski asked:

>1. Are the external (rear) connectors of a 1040 and a Mega in the same
> locations on the motherboard.

No.. every model Atari has ever released has been different.

>2. Are the two motherboards the same size.

No.. the 1040 motherboard is the full width of the integrated CPU/keyboard case, while the Mega ST is several inches narrower.. actually, the Mega ST motherboard looks like it would fit in a mini-tower case much easier.

>3. Does a Mega motherboard have the same plug in connector on it for its
> keyboard that the 1040 has.

Yes.. I believe the later ST models all had the same internal connector to the keyboard (six or so connections versus something like 16 in the original 520ST)

Sorry.. there's no easy answer for upgrading an ST...

I had some similar experiences with cheeth version 3, it trashed
my drive c:, so I had to reinstall even the hd driver. After copying
the program itself from e: to c:, there was nothing left on the drive
exept the clipboard directory, but I think it was made by Gemini after
the wipeout.

I cannot give you any ST-specific information when it comes to removeable
media, but I am familar with the SyQuest technology. I've quite a bit of
experience with the 44MB SyQuest for IBM Compatibles. I can tell you without
hesitation that it is a fantastic product. The removeable disks themselves
are sturdy, and we never had a problem with one of them losing data. We
got fast enough access time on the SyQuest that we used it as a normal
hard drive - not a backup device. In fact, we got to using the SyQuest
so much, that we purchased a tape backup system just because we were backing
up SyQuests, too!

SyQuest also makes an 88MB version, which you might want to look into, and
a dual 88MB version, too. I would not hesitate to recommend a SyQuest
product to anyone requiring hard drive space...who doesn't want to be
limited to just one set amount! It's a great way to increase your hard
drive space - just switch disks from your games to your applications disk
and voila! Another 44 MB of files.

Hope this helps!

Deanna (Hoping to be a Future Falcon owner!).

|> - Rahin
|> (rahin@scs.leeds.ac.uk)

It should be available from Application Systems in Heidelberg, but, what
I want to say: Be careful with the compatibility argument! For example if
you declare a procedure like:

procedure xyz(var some_text:string);

but call it later with something like:

var to_be_computed:string[80];
begin
xyz(to_be_computed);
end.

you'll get an "actual and formal var parameters don't match" error or
something like this. As far as I know this does not occur in TP. At least
not if length(actual)<length(formal). Don't know if there are more
incompatibilities, just this one.

5962. gcc1.40 versus Sozobon

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 10:02:26 UTC
From: ari@fwi.uva.nl
Message-ID: <1992Nov25.100226.23940@fwi.uva.nl>
Source record: 214311

Hello Atarians,

A simple question (?, I hope). I just installed the gcc1.40 compiler
and compiled my first program (Hello world). The size of the executable
was something in the order of 35 KByte. After giving the -mshort and
-O and -s flag, it was reduced to something of the order of 25KBytes.

I reduced the program to the next line:

```
main(){}
```

Even now the executable had a size of 25683 bytes. After this I used
the Sozobon compiler to compile this simple one-liner. It had now
a size of 3730 bytes.

Is there a way to avoid this big size with the Gnu compiler ?
I think it has something to do with crt0.o and the standard libraries.
Could someone give me a hint/trick

Thanks in advance
Arie

>but if it doesn't work with MiNT, what's the use.

The symptoms you describe are due to a common problem with ST screen
accelerators. In order to speed up text output, they clobber the ability to
redirect console output -- this is why the text goes all over the screen
rather than into the window.

I have Turbo-ST, and I just switch it off (via the accessory) when I need
to run text stuff in windows.

Source record: 214315

References: <24NOV92.09545441@meena.cc.uregina.ca>

There is no FTP site with Mad Max music on that i know of.However if you
want to rip that music then buy the Ultimate Ripper cartridge from Power
Computing.It will allow you to rip chip music as well as Soundtrackers an

samples.If you do this save the music as a .BIN file and you can play it
through STOS.
The cartridge costs about #25.and it is bloody good.

Duncan.

Don't know about CSTeX (I haven't got it), but ASCREEN does work fine on a MegaSTE. If you want to use FLIB's they need to be in the Eberhard Mattes (sp?) format, not those used by SHOWDVI.

>No. I think full screen programs should be banned as quickly as possible.

I should clarify myself a little bit. I'd request the window/full screen
option ONLY for use with those programs that pretty much take over the
screen (ARC Shell, etc) where you can't really get to any other task
while in it (aside from say using the file selector). That way, the
program would run as originally intended (full screen) or more
conveniently in a window (which would be more convenient in a
multitasking environment. Personally, I wouldn't mind seeing more
programs that are GEM designed (perhaps using GDOS as well).

The "full screen" dilemma hits me while running under MultiGEM. While
in a full screen program, I can't get to the menu bar to switch tasks,
which basically stops me from multitasking to something else.
Oh well, when MultiTOS comes out, we'll probably see more GEM-based
programs anyways...

5970. Falcon bus again

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 13:38:50 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Nov25.133850.12073@crc.ac.uk>
Source record: 214319

This is a mail message from someone who can't post messages.

From A.Mahmood@uk.ac.ucl.cs Wed Nov 25 12:23:43 1992
To: naffara@uk.ac.mrc-crc
Subject: Falcon bus width
Date: Wed, 25 Nov 92 12:22:51 +0000
From: A.Mahmood@uk.ac.ucl.cs

I am sorry to pick you at random but I do not have the ability to send
messages to any bulletin boards. Atari U.K. have stated categorically
in a lengthy phone call I made to them that the internal data bus is a
full 32 bits in width and that the address bus is the same size. Not
being content with this I phoned ST Format who have a Falcon 030 and
they examined their manual in detail and it clearly states that both
data and address buses are 32 bits wide. They were also very impressed
with the quality of the manual which is unlike any manual that has ever
been supplied with an atari machine. I am telling you this in the hope
that you will post this information onto comp.sys.atari.st so that it
may allay some of the confusion currently occurring. Atari U.K. can be
contacted on (U.K.)+(0753)+(533344) and the person to speak to is on
extension 219.

Thank you for taking the time to read this and my apologies once again
for picking you at random.

Amar Mahmood < amahmood@uk.ac.ucl.cs >

What I would like to know is:-
Is there a 32bit bus to some parts and a 16/24 bit bus to the parts which
don't need a 32bit bus?

Phil
(E-mail naffara@uk.ac.crc)

5972. Poorly ST (+ FAQ suggestion)

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 13:42:51 UTC
From: strgh@csv.warwick.ac.uk
Message-ID: <1evvsrINNiqg@violet.csv.warwick.ac.uk>
Source record: 214318

Please can anyone suggest likely causes for the following problem(s)?

When I switched on my ST (F, no M, recently upgraded to 4Mb + TOS1.4)
today, the keyboard light remained very dim and the (mono) monitor
remained black. On retrying, I got various combinations of:

black screen / 8 thick white + 7 thin black vertical stripes /
white screen with 2, 4 or many (9?) bombs

dim / OK keyboard `on' light

silence / pathetic quiet feeping noises from the floppy drive

I'd be very grateful for suggestions as to where the problem might lie
- I don't want to complain to the upgrader if it's `obviously' not his
fault (the upgraded ST has been fine for ~2 months), but my ignorance
of hardware is both broad and deep.

* SUGGESTION *
It might be useful to have a section on `Common Symptoms of Faults'
in the FAQ - symptoms of TOS bugs, viruses, hardware faults. My
problem may well have come up on the group before, but I'll have
skipped over it.

Many Thanks -- Ewart Shaw

If you just head down to your local AT&T phone center, they should have a demo of the video phone there. It is running on what appears to be the final body with a 2-3" color LCD screen. The video shown is jerky and fuzzy, but it does let you see the other party (standing back from the screen helped a bit). Very impressive.

Note that the demo is not a working model. I looked at the back of the unit the only connectors were for power, audio in, and video in. Obviously they were running a video machine though the unit, I would imagine those ports will disappear, unless AT&T will allow us to watch our favorite movie on the phone.

The PC GEM is pretty ancient, and doesn't use prototypes at all. (It also
uses longs to hold far pointers and other such horrors.) The VDI is REALLY
dense assembler, and I pity anyone who would want to make changes in it.

5979. Help w/ Timeworks DataManager ST program needed

Hello. we're using Timeworks DataManager ST on a 1040 STf.
We've run out of room for records at 3000, saving to a single
DS floppy. So we bought a hard drive.

Question is:
Will the 1 meg of memory be the next limit?
Is there a way to combine two data files w/ same format?

Your answers appreciated if you have experience w/ TDM-ST. No
guesses, please.

thanx in advance. Please reply email to lch3e@virginia.edu

Who the heck cares if a piece of software comes from a "big name company"?? I, for my part, am glad there's no Microsoft ("the people who brought you edlin" -- found in a .signature a while ago) trash around for the ST/TT/Falcon. Big name software definitely means big prices, but not necessarily great quality. It seems to me that it's the lawyers, not the programmers, who make big money in big name companies, and those who buy "big name software" pay them.
Regarding the examples above, I can't comment on the Kspread vs. Excel stuff, but if you don't like Kspread, you might want to look at X-act. The only reason why Calamus should not compete with FrameMaker is that FrameMaker doesn't stand a chance.

True, the mere addition of an FPU doesn't speed up anything, the FPU has to be used by the software, otherwise it's utterly useless. But if the software using the FPU ist the OS itself, the addition of an FPU can very well lead to a general speedup.
My question is therfore, do MiNT, MultiTOS, or TOS 4.0 support an 68882 FPU? It is my understanding that Motorola once intended the line F calls for implementing a software FPU emulator. Will such a software FPU emulator be part of any of the forthcoming OS versions? Is it possible, in principle, to write an AUTO folder program for existing Ataris that implement such a virtual FPU? This would create a large base of machines that can run FPU-dependent software. But I know this is not possible for TOS 1.2 and the dreaded TOS 1.0, since these use line F calls internally.

5985. Falcon bus size...

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 17:05:58 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Nov25.170558.16896@u.washington.edu>
Source record: 214330

I was sent this in E-mail....

I am sorry to pick you at random but I do not have the ability to send messages to any bulletin boards. Atari U.K. have stated categorically in a lengthy phone call I made to them that the internal data bus is a full 32 bits in width and that the address bus is the same size. Not being content with this I phoned ST Format who have a Falcon 030 and they examined their manual in detail and it clearly states that both data and address buses are 32 bits wide. They were also very impressed with the quality of the manual which is unlike any manual that has ever been supplied with an atari machine. I am telling you this in the hope that you will post this information onto comp.sys.atari.st so that it may allay some of the confusion currently occurring. Atari U.K. can be contacted on (U.K.)+(0753)+(533344) and the person to speak to is on extension 219.

Thank you for taking the time to read this and my apologies once again for picking you at random.

Amar Mahmood < amahmood@uk.ac.ucl.cs >

I'm not sure this agrees with what I've heard however... I thought the data bus was 24 bits to allow for more compatability... I heard there is an option ofr 32 bit RAM if you want it though...

Sounds like a weak PS to me.

I grabbed a PC ps, (old, but working) for $20US and grafted all the +5 wires into one bundle, and all the +12 wires likewise, also the GND wires.

I jumpered it into the power connector (where the PS plugs into the motherboard). It works.

I would buy a new PS... but at $80 for a whimpy PS.... I'll keep my "macho" $20 unit.

From: aking@BBN.COM
Message-ID: <lh7g66lNNr8o@news.bbn.com>
Source record: 214332

Atari TT For Sale:

CPU -- 32MHz, 030
RAM -- 8 Meg
DISK -- 80MB
MONITOR -- NEC 2A Color
FLOPPY -- 720K

Software Installed on Disk:
Lattice C 5, Mark Williams C, Alcyon C, STOS, DBMAN-5,
Neodesk 3.0, Dr T's Tiger Cub, Dr T's KCS 1.6, Many Others...

It's been used for about a year (1/91 to 1/92) at which point my
priorities changed. I occasionally turn it on to get files off of it,
and it seems in excellent condition. But I need the desk space and
cash. Priced to move:

Origional List Price
CPU/Disk/8MB-ram/KBD $4800
Monitor $400
Total: $5200
Pricing 6/92:
Basic TT $1666
upgrade to 8MB $500
80MB disk $400
monitor $400
Total: $2966

Asking $1400

That's less than half list, with lots of software thrown in. Send
your affirmative responses directly to me:

5989. Atari 130ST and 260ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 18:37:53 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1992Nov25.183753.26298@sactoh0.sac.ca.us>
Source record: 214340
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Another comment on an Atari "200", yes, in Europe there was a 260ST. In 1983-84 before the ST line was released, Atari had a center pull-out in the Atari magazines back then introducing the 130 and 260STs with 128k and 256k respectively.

Remember, these were the days that memory was expensive, and the largest home machines were 64k-128k. IBM PC were originally 64k and used tape drives, and the Apple Macintosh was a 128k machine.

So Atari prototyped the 130 and 260STs, with a disk based OS (TOS 1.0)

Also in the pull-out, Atari showed screen shots of the original GEM desktop, that was changed when the 520ST was released.

If anyone would like a photocopy of the pull-out, let me know.

You can remove the ninth or third (depending on type) chip from the
SIMM if you want to :-)

However, when buying SIMMs for the ST, take care not to get ones
which are *faster* than 70ns, eg 60ns - this can cause troubles, too !

5992. inquiry: "Matix Datensystem-Germany"

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 19:57:35 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Nov25.145735.1@vaxc.stevens-tech.edu>
Source record: 214338
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello World,

I found after much inquiriy that I cannot put a mega motherboard into my 1040-designed tower case. The reason I wanted this is so that I would have a megabus slot to add a third party graphics card to my system. Well I also found out that one can add a megabus to a 1040 via JRI's FPU upgrade, but a number of people that I have spoken with (all extremely competent hardware guru's), have told me that the megabus added this way works only marginally and cannot be trusted to fully function.

Rio/Datel advertised the reSOLUTION graphics card for a plain 1040, but alas I have found that it is not yet (maybe never will be) produced. So the only option that I see right now that does not require me to buy a new mega STE or TT (this would mean scraping a most incredible Tower Case!) is a graphics card manufactured in germany that is supposedly made for the original ST's.

This graphics card if manufactured by "Matrix Datensystem" and is called the "C32 board" it supposedly does 800x600 in 256 colors. Ideally I would like a resolution of 1280x1024 (i don't care if it is monochrome), but 800x600 would be acceptable.

If there is anyone who has any experience with this card or company could you please pass some information my way. They apparently have over 15 different graphics cards for the ST. I have not found one place in the US that stocks these cards. Perhaps a kind german could give them a call and find out about thereselection of graphics cards for stock ST's, I am sure that there are other interested parties besides myself in the US. If they have someone who would not mind a call from a ignorant american who only speaks english, then I would be happy to call them myself, but again I do not have a number for them.

Thanks to all the folks who responed to my ealiar posts about the megaST Motherboard, and Megabuss inquiries. If I get some information on these graphics cards my "Matrix Datensystem" I will post to the net.

Cheers,
Scott J Kolodzieski

5994. Falcon '030 has 16 bit data bus - REALLY?

Newsgroup: comp.sys.atari.st
Date: 1992-11-25 21:56:38 UTC
From: fwells@slc1.UUCP
Message-ID: <426@slc1.UUCP>
Source record: 214253

Is it true that the Falcon will have a 16bit 68030?

I'm sure I'll get some flames for this, but I have a real hard time envisioning ATARI going ANYWHERE with a 16 bit computer in today's industry. Having said that, let me also say that I really do prefer my 16bit STf, which I use regularly, over my 32bit 386PC at work, which I use even more regularly (although I do favor the speed of the 386 more). However, I really don't see myself -or many other folks- investing in a 16bit computer these days, considering that the new standard for the industry will likely soon become 64bits.

I've been following the Falcon thread in this group for many months now, and with much enthusiasm. But the prospect that the Falcon will really be a 16 bit machine is somewhat saddening. :(I am one of the many who would like to see this machine become a real competitor, but I fear it's demise if this is true.

Another point of confusion for me is the fact that I thought that the '030 was a 32 bit CPU.

Can someone accurately (key word here) confirm or deny this?

Actually, the company was originally called "Hi-Torro", but people
thought it sounded
too much like a lawn mower company, so they changed it to Amiga Corporation.
Check out the video "History of the Amiga"...

They also made something called a "joyboard". Lorraine was named after
the presidents
wife's name.

>disappear, unless AT&T will allow us to watch our favorite movie on the phone.

As I recall, AT&T has been poised to enter the home television market for some time now, as a competitor to the local cable companies. So, it's not such a far-fetched notion. The last scheme I heard involved a home unit that was pretty much a huge RAM buffer; you would dial up the AT&T video store and select a movie and they'd download the compressed movie right over the phone, and the box would handle decompression and playback...

hello

In the next advocacy group I heard about an atari based on the 030 moto
chip that costs about $800 US. - can someone mail me information about it?
I have questions such as: what C compilers are avaliable, what C++
compilers, and what graphics programs, etc...

eli

Annius doesn't like games.

As far as full-screen GEM applications go, it is those that have there
own desktop that cause most of the trouble (so do any that use the menubar,
but to far less an extent).

So, what's needed is a way of allowing applications to install icons on
some sort of global desktop, perhaps.

6000. Moniterm Viking on a TT- Help! Need GENIE info.

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 00:33:16 UTC
From: ax@sag4.ssl.berkeley.edu
Message-ID: <1f160clNNafp@agate.berkeley.edu>
Source record: 214350

In the latest ST report there was mention of a GENIE posting of how
to hook up a Moniterm Monitor to a TT. There was also mention of
a place called ASX that fixed Moniterms.

Does anyone have this information? It was in Cat. 4, Topic 25,
and Cat. 4, Topic 32 on GENIE.

If you have it, could you please email it, or post it here?
I'm sure any Moniterm owner would find this information valuable.
(I'm anxious to find out how to hook up my Moniterm to my TT when
I get it.)

Thanks a lot for your efforts!
Ax

6001. Z*NET International Atari On-line

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 00:39:00 UTC
From: jonc@status.gen.nz
Message-ID: <PZosuB2w165w@status.gen.nz>
Source record: 214329

Greetings from Z*NET Pacific,

Many of you will be happy to know we have fixed the big "control black hole" and propogation of the alt.znet groups have taken place over the last week.

Each week we will be placing the current issue of Z*NET in a news group called alt.znet.pc. For those of you who have not been getting this feed please ask or re-ask your system administrators to add this news group to your feeds.

CNEWS sites should by now have all auto created this newsgroup and you should see Z*NET Issue 9219 (this weeks issue) in alt.znet.pc.

If you have any questions about this news group or the other Z*NET groups please drop us a not in alt.znet.pc or any of the other znet groups.

Kind regards and long live the Atari!

Jon Clarke Z*NET Pacific

Judy Ranelli (judy.ranelli@the-matrix.com) wrote:
:
: My brother gave me his Silent Service 1 and I don't have any
: instructions. I figured most of it out but haven't found how to fire
: those rear torpedoes. Help!

There is no way to specifically fire them. They fire automatically
if your ass-end is facing the target. That is why it is better to
face away from your targets after you fire your first spread of
torpedoes because you can:

a> run away faster
b> let 'em have it with 4 loaded topedoes from the aft

Good luck. IMHO, SSI was the best ST game around.

Cheers,

Chris

I am not very familiar with UNIX systems at all, but it seems that alot of people are trying to get UNIX, or the UNIX "feel" on the ST. I would like to learn more about what kind of ST software there is that you guy's use.. I have heard that alot of people use MINT. What version are they on, and where can I get it from? What will it do for me? I just got a copy of GCC 1.40 and it seems really interesting.. It came with no docs just a huge program spread out in 4 disks.. Also GULAM was included.. It has some "docs", if thats what their called, more like a reference manual.. It is an interesting CLI with some wierd features, I like the MICROEMACS editor built in though.. I would like more info on this side of the world, I've been stuck in .PRG programs for my whole ST experience.. And how compatible is this stuff with windows and .PRG's, I want to learn something new, but not go "back" to MS-DOS.

6004. Programming Question

Date: 1992-11-26 03:10:16 UTC
From: darekm@microsoft.com
Message-ID: <1992Nov26.031016.14106@microsoft.com>
Source record: 214285

I'm posting this for someone else, so please respond to the person listed at
the of the file.

SALE OF THE CENTURY!!! update

ONLY TILL NOVEMBER 28th!

1. Calamus Font Resource Guide $7 each
These are the last 3 Font Guides that I know of. Hurry cause
once they're gone, they're gone!

2. K-Data $12
Only 3 left, nice GEM Database with complete manual in shrink wrap.

3. K-Word 2 $14
2 left of this solid GEM Word Processor, the price can't be beat,
includes manual in shrink wrap.

4. Docubind Binding System $59
Great deal. Total system to punch holes and bind the circular
like bindings to make small booklets.

5. K-Graph 3 $16
Extremely powerful graphing package. One left.

6. K-Spread 4 $59
An excellent spreadsheet on par with LDW Power. One left.

7. K-Roget $18
A great thesaurus at a great price. 1 left.

8. Forget-Me-Clock II $29
The best clock cartridge every made for the ST, 1 left.

9. TCB Tracker $19
The original MOD maker, you can make beautiful music with your ST!

10. MacSee $29
New copy of MacSee, Macintosh to ST file transfer

12. GEnie Manual $7
Includes entire manual and several pocket reference guides

13. Moniterm 19" Monitor $749obo
Mint condition, used less than 60 hours. Gel-anti-glare
reduction screen, includes interface board, and all cabling
original box and packing.

16. VGA Data Switch $49
Switch between 2 VGA monitors (for PC's)

17. Anti-Glare screen $14
Awesome deal, cut glare on your screen. Only 1 available.

18. 30 - 5.25" floppy disks $3
Perfect pre-used disks for PC or ST use.

19. National 5 Digit Zip Code & Post Office Directory 1990 $5
Great for businesses and individuals for sending stuff!

21. Shrink Wrapping System $179obo
Includes heat gun, shrink wrap, and shrink wrap holder. Works great.

22. PC VGA Card $75
Excellent, quick 16 bit video VGA card for PC's, awesome deal!

PRINTERS
----

1. AB Printer Switchbox $14

2. Printer cable $5

3. Juki 6100 Daisywheel $99
This is a powerful printer that includes the optional
tractor-feed to output typewriter quality print. Awesome deal!

4. SLM804 Laser Printer $349
Works great, just needs a new drum, still prints drafts fine.

5. Legend 880 Dot Matrix printer $69
Great printer for all common needs!

DISKS/DRIVES
----
1. IB Drive $89
5.25" Drive that plugs right into the ST, 2 left.
Includes FREE 24 (Twenty-four!) pre-used 5.25" disks!!

2. Disk/manual holders $2 each
These are perfect for your software product, they hold a manual
and disk as well as a slip sheet in front. 24 available, a very
good deal; lighter than 3 ring binders and much cheaper.

3. Disk labels $1 per 400
Colorful disk labels, incredibly cheap price!!

PARTIAL ITEMS
----
1. Leader Board $1
Missing key dongle.

2. Stormtrooper, Soldier 2000, Alien Syndrome, Galactic Conqueror $1 each
Rubber Stamp ST

Don't work correctly

3. Maxpak $1
Box w/ manual, missing disk.

4. Tetris, Police Quest 3 $1 each
Disks only (Tetris - 2 disks, PQ 3 - 3 disks)

5. San Francisco, NY, and Boston Flight Simulator II charts $1

6. Flash $1
Docs/binder only.

MISC
----
1. Migraph Hand Scanner w/ Touchup $250

2. Wico Command Control Joystick $9
1 available, still new in plastic bag. 3 Joysticks in 1!
Ball, Grip, and Stick handle swivel on, your choice.

5. Digisound ST $49
Sound digitizer for ST.

6. Computer Eyes Color Video Digitizer $89
Only one left.

7. Monster Stereo Cartridge $39
Plays sounds through speakers (RCA jacks).

OTHER COMPUTERS
----
1. XT VOICE MAIL SYSTEM $600 obo
Includes Big Mouth Voicemail card/software (which itself costs about
$300), XT computer with 30 meg hard drive, and monitor.

2. Macintosh w/ 2 MB and 20 MB Hard Drive $600 obo
Macintosh in great condition includes manuals, software, etc.

Cables 'n' Thangs

Funcion-Aid, function key template holder (fits next to Function Key spot
on your ST) includes 5 double sided cards to write down the functions for
different programs. - $2
----
3 Floppy Drive cables - $4 each
----
3 TV Hookup things - screw to TV antenna - $1 each
----
2 Computer hookup to TV Hookup thing - $1 each
----
1. Video Cable for TT computer - $14
2. TT modem cable - $9
3. 25 pin male centronics to 25 pin male centronics cable - $4

4. RS-232 cable - $6
5. Power Cords - $3 each (plug in almost universally to all computer components)

1040 ST keyboard covers, simulated leather - $3 each

External drive cover, simulated leather - $2

ST Software Sale

Cyber Studio/CAD 3D 2.0 Antic $8
Death Sword Epyx $3
Dive Bomber Epyx $3
Flight Simulator 2 Sublogic $8

An operating system has no use for floating-point arithmetic, though,
so that question is somewhat academic.

>My question is therfore, do MiNT, MultiTOS, or TOS 4.0 support an
>68882 FPU? It is my understanding that Motorola once intended the

MiNT, MultiTOS, and TOS 4.0 will all check for the existence of an FPU.
MiNT and MultiTOS will save and restore the FPU's registers during a
process context switch.

>line F calls for implementing a software FPU emulator. Will such
>a software FPU emulator be part of any of the forthcoming OS
>versions? Is it possible, in principle, to write an AUTO folder
>program for existing Ataris that implement such a virtual FPU?
>This would create a large base of machines that can run FPU-
>dependent software. But I know this is not possible for TOS 1.2
>and the dreaded TOS 1.0, since these use line F calls internally.

Now who was it who said they had worked up a scheme to make the line-F
handler work with both the old TOS and the FPU emulation... I thought
that was mentioned on the net here a little while ago?

It would be no problem to write such an emulator. I thought Motorola
even had one of their own, don't remember offhand. I don't think many
people would want to use it though; the overhead for trap-handling is
rather high and so you would get much poorer floating-point arithmetic
performance than you would have got by using regular subroutine calls
to your own math library. In other words, it's a poor solution for
machines without FPUs.

p> (i.e., ST-low, cache off, internal speaker off, RCA jacks connected) and
p> none of it works. It loads, the screen turns red, and it locks up.
p> (FYI: I have TOS 3.05).

Did you boot from floppy? A harddisk driver will kill it in a big way.

Boot normally, then alt-ctl-del, then press & hold alt.
After the floppy has blinked for the first time, still holding alt, tap the
spacebar. (make sure you have a floppy in a:).

You should get a low-rez screen, with no \auto stuff & no HD. Turn off the
cache, the rest doesn't matter. Then run Llamatron from floppy.

Works for me. (3.05)

Yes,
DR DOS 6.0 comes with a GEM-like shell (I'm not exactly sure as I haven't really seen it), which isn't surprising since it's Digital Research. Due to the lawsuits and such that Apple and others made in the past, DR had to 'cripple' the PC version of GEM (I think the current version of PC GEM is GEM3). The Atari GEM was unaffected by this. As for why PC GEM is slower, that's partially due to the inherent inefficiency of the 80x86 processors and possibly due in part to the coding of it.

6011. Re: Cheetah Copier problems

I think Cheetah has problems
(OBVIOUSLY! <grin>) with non-TOS partitions, so if you have any BGM
partitions or whatever, it's not a good thing to use. Same goes for older
versions of Michtron's Hard Drive Toolkit (except it doesn't recogise
partitions over 16MB in capacity).

From: bcballi@cs.vu.nl
Message-ID: <ByBK6r.LEs@cs.vu.nl>
Source record: 214258

Hello,

I recently bought a modemm, a PTT moduvox 101M+. But I can't
get it to work. There are two major problems. The first one
is that the modem doesn't recognise the carier (no dcd). And
the second is that it doesn't recognize any hayes commands.
There is a loop-switch, and when I've pressed it, everthing is
copied back to my ST. There is also a test-switch, and when I
press that one all lights turn on, except the dcd-light, and
the cts-light starts blinking.
If any one out there has the same modem I would welcome any
information I can get my hands on. But more importantly, are
there any other standarts like the hayes which I can try?

Groeten,

Gerco Ballintijn (bcballi@cs.vu.nl)

PS: The reason I know so little is that the modem-package
didn't contain any manual.

I agree, I was having a discussion with a firend about how applications
with their own desktop will cope --- I've seen a few things on the mac
which were written before multifinder was available, and they scrawl the
grey hash pattern all over your lovely colour squigles. The original desktop
redraws itself OK if you move windows around though.

|>
|> So, what's needed is a way of allowing applications to install icons on

But this would only work for new programs - any existing programs (and there
must be quite a few) which assume they have complete control of the screen
(resource editors, midi stuff etc.) will need something more. Possibly a key
sequence or a small button in ome corner of the screen which will always bring
up a dialog giving the option of bringing a new application to the top - and
letting the top application do what it wants with the desktop.

6016. Flash 1.6 RTS/CTS Flow Control

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 11:36:46 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1f2cseINN6su@golem.wcc.govt.nz>
Source record: 214260

For those that don't know, Flash 1.6 does not support RTS/CTS
flow control, but there are Fixes...

1. use serfx11, that will patch TOS to fix the software problem and
you also have to use a CPX to help with the problem with Flash not
using RTS/CTS Flow control..

But the is another way, its a File called HISPEED, it has a program
to patch Flash, so that RTS/CTS flow control works...

This I have tried and found that it works...

Except that I had a dip switch wrong and a Hayes command set wrong,
in my MultiTech 224E modem..

There is a simple way I used to test my setups, place the modem
in anolog loop back, and just send it a ascii file, this was ok, for
a slow 2400 bps modem, but could also be used for a faster modem by just
reading the text file in the buffer, you would soon see if data got droped..

Roger..... sheppard_r@kosmos.wcc.govt.nz

>incompatibilities, just this one.

On the whole it seems Pure Pascal is more strict than TP. I compiled a moderate sized application (about 6000 lines spread over 4 units) that I developed under TP 5.5 with Pure Pascal demo. It gave me two warnings, both related to unused local identifiers in procedures & refused to run. When I fixed these, program compiled OK and ran OK as well. There were strings (unsized) everywhere & I did not receive the error messages you mentioned above. Perhaps, it's to do with the strict var string checking flag in the compiler option menu.

I have uploaded the demo to atari.archive this morning.

If you mean a PC-minitower: Mega motherboards do *not* fit in this kind of
mini-towers -- it's even a pain to stuff them in big towers. And then...
all the re-wiring, (expensive) cables, floppy&HD placement... Yack...

In article <1992Nov25.071355.9951@ugle.unit.no> anderss@colargol (anderss) writes:
> Could anybody tell me what ST/Falcon WP they think is best?

That's Write, from Compo.

> I'm planning to buy one of these: Wordflair 2.1.1, Redacteur 3/4,
> Calligrapher Professional. But I don't know which one.

I haven't seen or used Redacteur or Wordflair. However, I have used Calligrapher Professional, and stopped using it again. Although it has a lot of good features, its user interface is incredibly annoying. It's _very_ slow -- though I hear there's now a version that doesn't need GDOS, so that might improve things (as would an accelerated processor). Secondly, the keyboard shortcuts are few and far between.

My personal hate was the font styling -- you pressed the control combination to change a block to italics, and a little pop-up menu appears. This invites you to turn italics on or off.

First of all, why does it have to ask? Every other word processor simply inverts the status of the selected text (i.e. non italic -> italic, italic -> non-italic, mixed status -> all italic). You also have to momentarily pause while the box appears. You can click on either option (but that involves the hand-to-mouse experience), or press + or -. Now, pressing + or - involves releasing the control key (which you had pressed down for the short-cut). Then you have to press shift with the left hand for plus, and anyway move the right hand up to + or -.

That's Write is better, IMHO, because it has consistency. You can use the mouse for almost everything if you want. But the shortcuts are logical, and involve the first letter of the menu and (usually) the initial letter of the option on the menu. Hence "Load" off the "File" menu is ^FL. "Italic" off the "Style" menu is ^SI. And you don't have to release Control when you type the second letter, if you don't want to.

So, this is why I *personally* prefer That's Write (and you may not agree -- that's your prerogative).

>68882 FPU?

The recent versions of MiNT and MultiTOS do support the FPU -- indeed, FPU
support is essential to MiNT, as it *must* save the FPU context when it does
a context switch (in the same way as it must save processor context).

I agree wholeheartedly with Dennis and would also recommend ST Applications as the best UK Atari magazine. (In fact, I actually started reading it on his recommendation some time ago). It is more along the lines of the late, lamented ST World. Personally, I'll only be ST Review, ST Format or ST User on the rare occasions that their cover disks contain anything interesting. (ST Review's Timeworks offer was pretty good).

ST Applications is the only UK mag that a developer, or more experienced user, would be interested in. If you do have a need for one of the 'glossies', then ST Review is probably, marginally, the least bad. But be *very* careful about what you believe in it!

6025. Generic MIDI util

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 16:37:25 UTC
From: cwa@oasis.icl.co.uk
Message-ID: <1442@ozz.oasis.icl.co.uk>
Source record: 214266

Does anyone know of a generic MIDI program for the ST, like CHAMELEON, or SATELLITE?

If so could someone post a uuencoded version to the net. I need some way of saving the sounds off my K4 without having to buy loads of RAM cards.

Thanks

>Another point of confusion for me is the fact that I thought that the '030 was
>a 32 bit CPU.
>
>Can someone accurately (key word here) confirm or deny this?

OK. Listen closly to this, because this is HARD facts from reliable sources:

The 68030 is a 32 bit CPU (data and addressbus have 32 pins).

The Falcon 030 is (mainly) a 32 bit machine, BUT, for cost and compatibility
reasons, the bus between CPU and RAM is 'only' 16 bit.

Some of the customchips have 32 bit access to the ram, which is 32 bit.

The 68030 can reside on anny bus size of either 8, 16 or 32 bit and even on
anny combination of these! This is called 'dynamical bus sizing'

The coprocessor interface between CPU and FPU in the falcon is full 32 bit.

Sources to this is Motorolas 68030 User's Manual, Wilfred Kilwinger who is
technical manager at Atari Benelux and John Townsend at Atari Corp. US.

Before people start flaming the 16 bit databus between CPU and memory,
lets check out the performance when we have it on hand, and not deem
it to be a nogood befor that!!!

In a previous article, drb@kepler.unh.edu (InigoMontoya) says:

>Just a couple of comments on the mindless dribble that has been posted by
>a certain person (claiming not to be an Atari basher).

I claim to be a realist, not a basher.

If I was a basher, I wouldn't give any reasons, I would just say
that Atari sucked.

>
>Item one, this person asserts that no game machine with a twelve button
>keypad was ever succesful. Hmm.... Ever heard of the ColecoVision? Thought
>you did. Yes I know that they went caput after the ADAM fiasco and investing
>ALL of their money in Cabbage Patch dolls. This does not change the fact
>that the ColecoVision was an tremendously succesful machine.

The ColecoVision was a failure.

Coleco brought out their 12-key keypad and Atari brought out their
2600 with a joystick with one button.

WHICH is considered a success and failure my friend?

Ever believe in "Make it SIMPLE, STUPID?"

Atari will be making a complexed joystick controller that will only
be attractive by COMPUTER USERS like OURSELVES.

They need to separate their computer thinking from their video game
thinking because even though they are closely related, they are different.
And there is a different market.

>

And to the last part of your question relating to KAY-BEE toy stores
and the Oddesy II, the Lynx can't even be purchased at KAY-BEE.

This is another reason I'm upset with Atari.

There is only one product that Atari has ready and will have at least
60 games available for it by Christmas. This is the Lynx.

It is a fantastic machine, yet, Atari's management has obviously
decided to forget about it this year (which is the only year left for it)
and save up for pushing the Falcon next year.

I'm sure if Atari pushed the Lynx this year, they would have plenty
of cash to push the Falcon next year.

6033. MiNT Desktop Ideas - Thanks + Summary of some ideas

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 20:37:31 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.722810251@oxygen.sys.uea.ac.uk>
Source record: 214272

First of all: Thanks to everyone who mailed me.

I'm still open to any and all suggestions... keep 'em coming.

OK, here's another list of features. Some of these were ones I forgot in
the original post, some of these I've thought of since the last post possibly
spurred by someone's comments, some are attempts to clarify queries, some are
the idea of a sole poster, some were mentioned by many people. I haven't
credited the people as I'm far too disorganised to do that. The other reason
is that I kind of lost a load of email. I didn't miss anything, I just went
and lost ones I'd read. Besided, you know who you are... credits start
getting dished out nearer the finished product.

OK here we go...

- Full support of MiNT extended filesystems :
Extended filenames
Non-standard (in TOS) chars
- Lots and lots of configurable icons :
Connected to file type/installed program or any common-or-garden file.
Support for 256 colour IF YOU HAVE THE NEW AES - as and when I find
out how to use the new features... testing may be tricky :-)
Special file format (what another ******* file format !!!)
Loading of Atari/Gemini/Neodesk icon files... so that's OK then.
- Applications menu.
Probably 16 menu slots into which your favourite applications can
be installed. The menu item will be independent to the program name.
If and when I get MultiTOS, the menu will provide the same kind of
functionality as the application list in the Desk menu of NewDesk(tm)
- Full "clean" use of XXX-GDOS (replace XXX with suitable prefix)
Each text view window can have its own font/size setting.
No, I'm not providing dynamic font handling on the desktop get one of
the new Atari GDOS's (SpeedoGDOS, FontGDOS or whatever)
- Custom sounds triggered by special actions.
Fully configurable settings within desktop (or maybe a CPX...)
Use of signed/unsigned raw sound files, AVR files and any other
ones I find a easily usable format for.
Support for Falcon's 16-bit stereo sound as and when..
- Use of TOSWIN
TOS/TTP can be configured (individually or globally) to run in a TOSWIN
window or use the whole screen with the setting toggleable via a key
modifier when the program is double-clicked.
Possibly provide a TOSWIN/MW like ACC instead which is configures
specially for use with my program. And perhaps bug-fixes...
I seem to be able to lock up TOSWIN. It may or may not be my

program though I think I can do it with other programs...
This needs investigation.
- Support for both ARGV and xARG (anybody want MWC-style args too?)
- Batch file of some form.
Startup and shutdown scripts as well as double-clickable ones.
No idea of the syntax/features provided... any suggestions?
- Customisable window decorations (like TOSWIN)
- Full clipboard facility
Memory based for speed
Full file handling facilities as if it were a directory
Dump to disk option... Menu option plus auto-dump on quit(configurable)
- Recoverable trash can
Of course I mean to implement this even though I didn't mention it.
Did everyone just assume it would be there or what ?
- Expandable file viewer
Simple file text viewer... to screen or window, windows permitting etc
External modules for different file types, RAM resident ability
Of course, double-clicking a file can always be made to run a suitable
program but most-likely that program will not like being made resident
-- Standard ASCII config files
Lots at the moment. Hope to trim it down, possibly to 1 maybe to 2-3.
Configuration allowed within the program.
Can read in DESKTOP.INF/NEWDESK.INF files and act appropriately
(Such as say "What kind of **** is this ?" :-))

Well that's about it on the ideas... I probably missed some again but that
just allows me to make more posts later...

So far I have implemented only a small fraction of this and the list of
required features is growing rapidly. I hope to allow the finished product
to run on a 1MB+HD machine... 1Meg is minimum for MiNT+anything and even that's
pushing it. I'm not sure about the HD requirement but this thing may be
fairly disk-intensive, especially if you've got only a small amount of RAM.
Initially I'm just going to produce a test version which will run in however
much RAM it will run on but later I hope to trim it as much as possible and
perhaps provide some sort of modular system which optimises disk/RAM usage
(or not if you configure it wrongly :-))

Please bear in mind that I've only just started this and there's a lot of work
to be done so don't expect anything too soon. Early January is my current
target for a reasonably functional test version... I'm going home for Xmas
but I intend to take my machine with me.

Again thanks for all the feedback and keep it coming...

Oh yes, first prize for the number of comments and suggestions goes to...
(DRUM ROLL)... Chris Herborth <herborth@pinot.waterloo.ncr.com> (APPLAUSE)

I hope to produce some sort of full rundown of the existing and planned
features to be available by request via EMAIL next week sometime.

Finally, I am, as all sensible people should be, looking for testers for next January (maybe midDecember if you're lucky). I'm going to try and get a representative sample of ST/TT/Falcon(yeah,right) owners covering all possible TOS's, machines and popular add-ons etc. So please send your setup and offers of help to me within the next fortnight or so....

Bye for now,

Steve.

-Steve Sowe.... (I can't be bothered to type the rest)

6034. WANTED: LeaderBoard or other golf game for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-11-26 21:48:12 UTC
From: jared@midiline.la.ca.us
Message-ID: <239uuB2w165w@midiline.la.ca.us>
Source record: 214274

I know that LB is no longer made for the ST, but does anyone still have it (with the dongle, naturally, unless they did some super fantastic hack on it so that the dongle is no longer required), or aother golf game as good as LB they can sell me or advise me towards to buy elsewhere?

Reply in Email to: jared@midiline.la.ca.us

From: H46CC%CUNYVM.BITNET@VM.ITS.RPI.EDU
Subject: Re: is it true-ATARI SUPPORT ?
To: oyakea@rpi.edu
Status: RO

(sorry, don't know how to quote previous articles, but...) It's true about NeX
T developers on the Falcon. At Comdex two NeXT developers were showing their pr
oducts for the Falcon. One was a Voice Mail system (the company's name I don't
remember and can't find in the Winter 92 NeXT Software and Peripherals Catalog)
. The other was Singular Solutions' A/D64x sound recording system (page 55 of t
hat catalog). Besides these developers, Kodak also signed a contract with Atari
for the development of their PhotoCD system on the Falcon, bringing the power
of Multisesion photoCd's to the home (the software package is about $2-300, and
the Falcon can accept about any CDrom drive available). The reason that people
are choosing to develop on the Falcon (coming from such a nice env as NeXTstep
) is that the Falcon is the only other system on the market with as fully inte
rgrated a DSP as the NeXT (with a faster DSP to boot at 32mhz compared to the N
eXT's 25mhz) and is the lowest priced system with DSP of any system (DSP boards
on an Intel machine run about $3-500 alone and the aren't full functioning/Ful
ly integrated DSP's). So, programmers wanting to use DSP and do so on a machine
that should sell in relatively large quantities, then they would at least look
at a Falcon. (And Gem/Multitos is a MUCH nicer and better Multitasking OS to wo
rk in compared to Dos/Windows (can't say OS/2 since I haven't used/programmed
on it yet)!!!)
Jarius Jenkins

************************** MAIL ENDS HERE ************************************

Apparently some next developers like the Falcon. On the other hand the guys on
Amiga advocacy group have a discussion who needs a DSP ? They also call the
56001 DSP a cheap gimmick and claim one only needs a dsp board for thier A1200
or A4000. True, but at least there is a consistent DSP implementation across
the Falcon line, something which no Amiga has. And as seen people apparently like this.
January is less than six weeks away so all Falcon lovers may soon have their wish.

6036. ATARI GRAPHICS CARDS

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 00:16:11 UTC
From: oyakea@warren1b.its.rpi.edu
Message-ID: <zc719-q@rpi.edu>
Source record: 214284

I have just finished reading an Atari mag which reviewed several Atari graphics cards I will list them below:

The Leonardo Card:
From Lexicore- A TT / Mega STE 16 bit graphics card, includes genlock capabilities and SVGA support, compatible with Phase-4 packages,
price - $599
availability - unknown (BTW last time I heard of Lexicore they were in possosion of a Parsec Graphic Interface).

The Cyrel Sunrise:
From Cybercube Research ltd.- VME based video card, compatible with the TT and Mega STE. Resolutions are 256*200 mono to 2048*1024 color. Provides a 16.7 million color palette, a 32 bit frame virtual rez for video, and is NTSC/PAL compatible with genlock. Also to come is their Vidimix 16 card, which adds real time frame grabbing in true color, and can display video in a gem window, and can combine Atari graphics and video to allow animation-video mixing and other effects.
price - $1500.00
availability - unknown

I have not heard anything else about these cards and presume they could be vapor-ware victims. That is why I wrote availability unknown. If one of you dear readers could please call Lexicore and find out what is going on ? that would really be helpful to some of us.

Any one know of an Atari installed in a 19" rack ?

responses are very welcome.

The SCSI controller is integrated into the drive, but many Supras have an external SCSI connector which can be used for additional devices, like a SyQuest drive. You may be able to use the SyQuest with the Supra, but not instead of it, without buying another controller.

ICD now sells their AdSCSI controller in a stand-alone box for under $100, and you can connect a wide range of SCSI devices to it. Another option is to buy an integrated package (SyQuest w. AdSCSI) from someone like Toad Computers in Severna Park, MD. I have one of their combination systems, the "96+" with the ICD AdSCSI, a 52 Mb Quantum drive, and a 44 Mb SyQuest for both backup and extra storage, and I quite pleased with it.

>performance than you would have got by using regular subroutine calls
>to your own math library. In other words, it's a poor solution for
>machines without FPUs.

I think that's a pretty major exageration. The difference between a
TRAP and a JSR isn't all that great, plus it save on space! When you
consider the time taken to do even a floating-point multiplication,
the overhead of the TRAP is absolutely insignificant.

Besides, applications that use floating point are generally quite
serious applications - the sort that people upgrade computers just
to run them (CAD packages, 3D rendering, etc).

6039. Need hard drive advice.

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 03:02:23 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1f433vlNNjda@tamsun.tamu.edu>
Source record: 214287

Please suggest what I should do.

I had a Supra 60Mb and Supra 20Mb hard drive. The Supra 60Mb hard drive
died in a power failure. I belive that the hard drive only is damaged.

I want more disk space that 20Mb. I want around 100Mb+.

What I am currently looking at is buying a new 120Mb hard drive new for about
$500. The drive will have a clock and a controller and be a "monitor" style
drive (I don't know what that is). The new drive will have an ICD or Supra
host adapter.

Since neither or my Supra drives have a DMA output, I don't think I could
use the controller's in them to perform daisy chaining. The 20Mb drive have
a SCSI 25-pin port on the back though. The 60Mb has the controller soldiered
directly to the drive, no slide-on connector.

My question is: What are my options? and what kind of setup can I get
so that I can backup my data on my 20Mb drive?

Forgive my ignorance in this area. While I am a student of computer
engineering, I am not familiar with the Atari ST hard drive scheme.

Are there any known games/software that allow you to play against someone
on an IBM via the modem?

6041. GCC 2.3.1 Distribution Question

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 04:50:06 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1992Nov27.045006.13958@csi.uottawa.ca>
Source record: 214202

There's not much in the way of documentation with the 2.3.1 archives.
Thus, I have two quick questions:

1) Is there any kind of listing of major changes between 2.2 and 2.3?
I've been using 2.3 for a few days now without any compatibility
difficulties thus far. Are there actually any notable bug fixes?

2) There seems to be an additional compiler executable. Something
resembling gcc-cc1obj.ttp (which installs to gcc-cc1o.ttp, after the 8
character limit). What is this? Could it be the compiler executables
for the Objective C compiler? (In which case, it's probably not a
WHOLE lot useful, because there's a LOT more C++ code out there.)

Inquiring minds want to know.

>must be quite a few) which assume they have complete control of the screen
>(resource editors, midi stuff etc.) will need something more.

Hmm. I didn't communicate my idea very well at all. It has to be
something that works for many existing applications. One fairly simple
technique could be to make the wind_set(NEWDESK,..) objects that
applications install stack up. PLUS, have an attribute in the objects
that mkes that object logically transparent. Then, it's only a matter
of making the root window object physically and logically transparent.
It really can't be that difficult. It's really just a slight change in
the semantics of the wind_set(NEWDESK,...) call to mean "Add the
children of this object to the list of children for the current desktop
object", rather than "Replace the desktop object with this object".
And of course "wind_set(NEWDESK,0,0)" then means "delete this applications
new desktop children".

Sure, tricky, but what's the problem? Do we want the UGLY X-windows
and MS-Windows view of things where windows are all there is?

If you say YES, then the other solution is to make the "NewDesk" call simple
create another window containing the given object. Or perhaps allow the users
to drag an area for the application to use when it is run.

Think of all the programs that grab the desktop...

I think Calamus does - to put it's logo on it. PageStream used to, but now
doesn't.

'I'm wondering if anyone has any information on a multisync monitor
for the ST that meets the all of the Swedish emission standards.
I spend many hours in front of VTDs at work and would like to
minimize ELF exposure during the hours I spend on the computer at home.

It seems that there are a number of non-interlaced, analog monitors that
don't work with the ST and that one needs to use care in picking out a
workable multisync.

If there were such a monitor that would also display the Mac Hi resolution
of 832 by 624 that would be marvelous.

Thanks,

Tony

6045. Interested in improving Mandelbrot/Julia Generator ?

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 06:00:07 UTC
From: mjuschke@tartarus.uwa.edu.au
Message-ID: <1f4dh7INN7a6@uniwa.uwa.edu.au>
Source record: 214201

Hi,

last year a friend sent me an algorithm for Mandelbrot and Julia set generation in GFA basic. I wrote a program having menus, internal picture save/data save, disk save/load, step size for very course to pixel fine, redraw/enlarge, and some others.

The problem is, it isn't the fastest (about 2 hours for low res in fine mode at 100 iterations and a limit of 4). Now I have seen a program from 1988 by M.S Powell, UK.It is in assembler and QUITE FAST (about 10-30 minutes), but does not offer all the features I put in mine. Since I cannot contact him to ask (probably left the address given in the 1988 documentation), I decided to post this bold inquiery/request.

As my GFA compiler seems to be as fast as my Turbo C, and I don't have a clue about assembler, would some assembler freak be interested in probably a lot of work to improve my PD program (credits included!) and partially or completely rewrite the thing in assembler ?

If so, or if you are just interested in a copy of a slow program, mail me for a source code or a uue program :
mjuschke@tartarus.uwa.edu.au

Till then
Michael

From what I can tell, the major differences are that the menu bar has the
desk accessories entry on the far right of the screen instead of the far
left, and there are no more zoom boxes in the PC version. Anything else
about it that's "crippled" ? (No real curiosity here, god forbid I should
write for Intel platforms ever again....)

It's likely that only the controller board is dead, and by replacing that
board you can revive the drive and get your data off of it.
>
>What I am currently looking at is buying a new 120Mb hard drive new for about
>$500. The drive will have a clock and a controller and be a "monitor" style

>host adapter.

Ah, you're going to buy a complete package with case and power supply and
host adapter? That seems rather wasteful since you must already have cases
and power supplies for your current 20 & 60MB drives, and you must already
have at least 1 host adapter. You only need one host adapter total in your
system. That converts from Atari DMA to SCSI, and from there you just hook
up any SCSI device you want. (Well, it has to support async transfers, which
all SCSI devices are required to do, and it must support no-parity transfers,
which not all devices will do.)
>
>Since neither or my Supra drives have a DMA output, I don't think I could

Here's the scoop:

ST --(Atari DMA)-- host adapter --(SCSI bus)-- device
device
device

If the devices don't have dual SCSI connectors on them, you can just get
a cable that has extra connectors on it. You can have up 20 feet of cable
in the SCSI chain, just get a good strand of ribbon cable (say 6 feet or so)
and clamp dual-inline connectors on it where you need 'em. One at one end

to plug into the host adapter, one at the other end for a device, and extras somewhere in between for additional devices...

6049. How to install new Deskicons under TOS 2.0[56] ?

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 08:05:02 UTC
From: mk@Materna.DE
Message-ID: <mk.722851502@materna>
Source record: 214204

Hello,

I've got a Mega/STE with TOS 2.05. As far as I know I can install a file
called "\deskicon.rsc" in the boot-partition of my system and use the
icons defined in this file.

My question is: How can I edit this file ? How can I merge new Icons, that
are supplied with programs like GemView et al into this file ?

If possible I would prefer to use PD software.

Thanks,
-Mic

Why not replace the pull down menu manager with a pop-up menu manager that works off the right hand mouse button (like those used in MGR and X-Windows) ??? That would make the menu dependant on the window, and no appilcation would need to own the menu bar at all....just a thought....

For those of you depressed about the fact that PC versions of software tend to be more advanced than ST versions, I've just read the Future Music review of Cubase for Windows. Smug grins all round, because the conclusion was that it wasn't a match for the ST version (no score editor, no phrase editor, timing glitches....).

It looks pretty though.....

If this is true, I think it is a smart move for Atari, at least if they can pull it of fast enough. I know *I* wouldn't want to go back to the STe case, and I think a large portion of the potential customers agrees; I have heard the same from other people.

In my opinion they might even consider a tower configuration with some expansion slots. Perhaps that would be too expensive for their base model.

HiSoft (who coincidentally support Bob's Diamond stuff in the UK) sent me a
glossy newsletter yesterday. Among all the snazzy True Paint Falcon stuff,
there was a coy little paragraph about Superbase:

"Following the sale of the ST and Amiga versions of Superbase to Oxxi Inc,
with whom we are working closely on a project for the Falcon030... [more
about Superbase Professional availability deleted]"

So, sounds like there's a good relational database on its way for the
Falcon!

Well, I had a 260ST. The only difference with the 520, if I remember correctly, was that the drive and the keyboard were sold separately. It had 512K standard, as did the 520.

There is no 130ST, this is a 130XL, which is basically more of a high-end 8 bitter. It did have sort of an ST casing, though. And frankly, the graphics and sound were not too bad at all, compared to an ST.

Yeah i'm also interseted in Mandlebrots and stuff but cant get them fast enough..

I do however have two PD programs that take approximately 40 SECONDS each for the initial 'snowman' mandlebrot... I have the source to one of these and will try to mail it too you when i figure out how. It is however very complex with almost NO docs or comments at all... Either that or you should be able to find it in any decent FTP site I think it was called MANDEL (aren't they all ???).

Hope this will help you, Ian.

All right, action games should be able to hack the system (they can do so in the AUTO folder). What's wrong with xtetris, for example, which neatly works in a window? Isn't that a lot better?

>So, what's needed is a way of allowing applications to install icons on

> Is there a way to avoid this big size with the Gnu compiler ?

There are several ways of reducing the size of the executable:
- use the MiNT library
- if you are using the MiNT library and you don't need stream-orientated
input/output you can #include <minimal.h> instead of <stdio.h> to further
decrease the size
- if you don't need formatted output puts() is smaller and faster than
printf()
- remove the symbol table from the executable with 'xstrip' if you don't
need it

There was indeed, there still are even. I still use my original 260 ST (dated September '85, if I remember correctly) and original monochrome monitor. It has survived two ROM upgrades (to 1.0 and 1.4) and one RAM upgrade (to 2.5 Meg), one self-built TV-signal modulator and several MMUs. Oh, before I forget, the single-sided diskdrive is still with me, but I no longer use it.

>So Atari prototyped the 130 and 260STs, with a disk based OS (TOS >1.0)

I don't know about the 130. But not only was the 260 prototyped with a disk-based OS, it was sold with a diskbased OS, version 1.0. I still got the disks, and the original two ROM-chips. But, it was no fun having only .5 Meg and using some 195 K for the OS. So I bought TOS 1.0 on the six ROMs and stuck 'm in.

I really can't remember the difference between the 260 and the 520. Was it that the 520 had TOS in ROM (.5 Meg - OS = .25 Meg?)? Was it that the 520 came with a double sided disk-drive?

NOO! Well, I have my good'n'old 520 ST, which I bought Summer 1986, but then it had been out a while in Norway. It came with .5 Meg, TOS on _disk_ and with a single sided drive.

But as far as I've heard (another rumour :-), the 260 and 130 were initially designed with 128 and 256 Kb, but then Atari changed it's mind. I even heard that some 260 with 256 Kb were sold in Germany before the upgrade to 520 came. Can anyone fill out or rule out anything of this ?

Jarle.

Have you actually looked at the instruction timings? I can't remember the
exact details, but I think JSR takes about 10 cycles and TRAP about 50 (on
a 68000). Also RTE takes longer than RTS and you would use BSR not JSR.
I expect TRAPs/LineFs have been considerably optimised on a 68030 though,
and since only on these processors and above are you likely to have a FPU
it would be a good idea to use the Line F system for floating point on the
Falcon (Does anybody know if Atari have put a Line F FPU emulator in TOS 4?).

6068. Printing multi-page files to SLM, in Ghostscript

Newsgroup: comp.sys.atari.st
Date: 1992-11-27 15:36:05 UTC
From: cordes@ac.dal.ca
Message-ID: <1992Nov27.113605.9177@ac.dal.ca>
Source record: 214227

In using Ghostscript to try to print the file f2c.ps with the SLM driver, I found that only the first two pages (out of, I think, around 26 pages) get printed. When gs starts working on the third page, two or three fonts get loaded, then comes an error message:
gdevslm: Could not allocate memory for printer bitmap!

I'm running on a MegaSTE 4, with over 3Meg free showing in gulam. Would anyone happen to know what the source of this problem might be? I haven't tried printing any other ps files with more than two pages, by the way.

On a related note, there doesn't seem to be any way to select pages for printing in ghostscript; i.e. you can't start at page 3 and go to page 6, say. Too bad!

The version of gs I have is Revision 1 of v2.31 (from the file gs231upd.zoo). Has v2.4 appeared yet?

Thanks in advance for any helpful comments.

Which Atari mag?

Regarding the graphics cards, I had asked Lee Seiler of Lexicor (no 'e' on the end) several months ago when Leonardo would be out and he said a conservative estimate would be November. Well, I can tell you that it's not out. Apparently, he's been trying desparately to get Atari to make a 24-bit VDI for it, and they've just started doing this recently. That seems to be the major hold-up. I'm on the waiting list for the card.

As for the CyberCube cards, DMC Publishing (of Canada) uses these cards wherever they go for a show, so they should be available, but I've never heard of anyone buying them. I don't even know how much they cost; they may be very expensive.

I have the following items for sale -

1- Olympia NP compact 9 pin printer.
Has both serial and parallel interfaces - good workhorse of a
printer - also has NLQ mode - about 100 cps
Price: $100 or best offer

2- Atari ST - 4 meg memory and 16Mhz upgrade with mouse etc.
Price: $ 150.00

3- 2 800K SF314 floppy drives with power supplies
Price: $ 45.00 each

4- SM125 Monochrome monitor
Price: $ 100.00

5- SM1224 Colour monitor
Price: $ 100.00

6- Spectre GCR with 128K MAC ROMS
Price: $ 150.00

7- Supra 30 Meg hard drive partitioned as 20 Meg MAC drive and
10 Meg ST drive - Tons of Mac software to use with GCR
Price: $ 200.00

I would prefer to sell all together if possible.
Prices are negotiable as is shipping

That's exactly what a desk accessory (.ACC) does; it stays resident in memory and waits for a GEM event, usually selection of the accessory from the Desk menu. I suppose other GEM events could be used, but conflicts could exist with some .PRG which uses the same event for something else.

It is also possible to write programs for the AUTO folder which terminate and stay resident; I've seen a couple programs which trap the Alt-Help keystroke and save DEGAS images of the screen rather than print. Anyone care to reveal how this is done? It may require a few GEMDOS calls, and trapping keyboard events before they're passed to GEM.

Well, you are basicly right, but the TT has 64 bits wide ram, which means
64bits*16MHz=1024kbits/s or more properly 128Mbyte/s. The CPU runs on
32MHz and a 32 bits bus which also gives 1024kbits/s or 128Mbyte/s, so
the TT was souped up in a very nifty way. :)

On the Falcon the videobus is 32 bits wide and runs on 16MHz which gives
50% of the performance of the TT's videobus. Tests showed that the Falcon
has 50% of the TT's performance, which gives us the clue that maybe the
16bits bus between CPU and COMBEL may be faster than 16MHz. I say *maybe*
because I don't know enough, and don't have enough facts about the
hardware specs. Maybe they use the burstmode that's available on the 68030
to and from the COMBEL chip, that would be a real smart solution. (If it's
possible to do).

Whatever the answers are I'm going to buy me a Falcon because it's a good
enough machine for me, and I'm not complaing about unimportant details.

The registered version which I have had for a year or more (2.41g I think)
was compiled with GFA Basic v3.6, which I believe is the version designed
for use with a TT. I know that doesn't mean that it necessarily runs on the
TT; perhaps someone out there has tried it??

>
>Sander SToks
>sanders@sci.kun.nl

Nope, there *was* a 130ST. But it was basically a beta-release of the machine.
This was *really* primitive, it didn't even have enough base-RAM to run
TOS without a RAM upgrade!! Upgrading it to 256k let you run programs of
about 50k in length!!

It was a pretty sad machine - why Atari even *thought* of releasing such a
thing is beyond me. Although it never (along with the 260ST) made it onto
the commercial market!

TOS 1.0, 128k of RAM, external disk drive, no RF-Modulator (but no one actually
uses them right 8-) What a great machine... *NOT*!

Although, compared to the 800XL, it was an improvement! (Ahhh... Those were
great little computers those things!! Great games like Dropzone,
Biffdrop, Montezuma's Revenge, Jet Set Willy.... A lot of which have never
been duplicated on 16/32-bit machines. (There are rumours about a
ST version of Jet Set Willy, which'd be worth looking out for, very simple,
and very wierd game!)

I would advise some caution in dealing with Chris Wiliams. I've done many deals on the net with no problems except for the one time I dealt with Chris. He misrepresented what he was selling, demonstrated lack of good faith, shipped COD with a much higher amount than agreed upon (this was probably an honest mistake, but he still did it), shipped only part of what he promised, shipped defective merchandise - (junk really) as fully functional, and generally made me regret dealing with him. If you want more details, please email me.

Mark

PS I think that the ST chip set he is selling for $29 came out of one of my STs. He gave me $15 for them.

I purchased a color composite monitor for my 1200XL from Chris and had no
problems whatsoever.

I only live half an hour away and I picked it up from him. Price was the
same and the monitor has not failed or given me any trouble at all.

I have seen his closet and it IS truly full of atari....

Anisko @ usdtsg.UUCP and related Odessey II rememberers:
I think the game in question (cloth map for kyboard) was called "Quest for the rings" - it was actually one of the funnest computer games I've ever played even though it doesn't even match the graphics of today's games. Then again - it could be because I was something like 8 years old also (maybe a little older). Concerning that AND old 2600 games: I wish someone would make some silly th8ing that perhaps plugged into the ST (and newer) computers, whose purpose would be to plug in an old 2600 (or 7800, or Odessy, or whatever) game and run it through some emulator software.

I really don't see the BIG problem with the STE case...

The system was built as a home computer, not a serious business
system.

Besides, if Atari sticks a 16 MHz computer into a PC or tower case,
they will get laughed at big time.

If they are coming out with a PC case, they as might as well push
the clock speed up to 33 MHz.

A tower case, let's see a 68040 at 40 MHz.

In my opinion, if they make the keyboard a little better, I wouldn't
mind a Falcon030 in a 1040STe case.

>AdSCSI. Just plug it in and partition it, nothing to it. Btw, if anyone would
>like to buy my 44MB drive (so I can buy an 88MB unit, heh) drop me a line.

A customer came into the store today saying that he was trying to add a
Maxtor 130meg drive to his system, to fit next to his Syquest 44meg. Seems
he had some problems so he called ICD and was informed that he had to buy
an AdSCSI+ host adapter because the old h.a. he was using "wouldn't work"
in that configuration. Well, he was mighty upset when I told him that _I_
use that same config (old h.a...) and then he started telling me about how
rude the guys at ICD were on the phone. Myself, I've never had a bit of
trouble from them (although I get really irked when they automatically
presume I'm using an AMiga... I make a point of reminding them where their
roots are.)

Anybody know any reason why my old host adapter SHOULDN'T be working with
my Maxtor/Syquest combo?

From: afonseca@terapin.com
Message-ID: <afonseca.2eqx@terapin.com>
Source record: 214248

I'm somewhat insecure as to how the Falcon will be supported by ATARI Corp. after its realeased to the general public and at our local dealers... I feel that ATARI is really playing a cruel joke with us.. I just heard that FSM GDOS was discontinued because SpedoGdos or whatever its called, *WILL BE OUT* soon. Geez.. What about the people that invested in FSM GDOS programs? I really hate the way ATARI makes new computers and doesn't give you the capability to upgrade to the new system.. Example: IBM 386, you can upgrade to a 486... Can I, an ATARI 1040 STE user upgrade to a TT030? To a Falcon 030? I don't think so..

Will ATARI Corp. make the Falcon 030 and then an 040 in a mini-tower with new addon cards that I won't be able to use if I buy a Falcon 030? Then they'll say, buy an 040..

I don't know, I'm getting frustrated.. I will take a look at the 030 and compare it to a 486, sorta within the same price range.. I think I'm confused.. Any help is appreciated.

6084. znet magazine in the comp.sys.atari heirarchy? PLEASE READ

Newsgroup: comp.sys.atari.st
Date: 1992-11-28 05:40:59 UTC
From: dogbowl@dogbox.acme.gen.nz
Message-ID: <1esXuB4w165w@dogbox.acme.gen.nz>
Source record: 214250

As many people are aware, alt.znet.* was created some time ago.

However, due to misunderstandings of newsgroup creation, these groups
are being 'x'd to oblivion at many sites around the world, due to
system administrators getting sick of seeing them appear in their
junk area.

I propose that the alt.znet groups be brought under the comp.sys.atari.*
banner, to eliminate confusion over their origins, and to allow greater
propagation.

I had in mind the following:

alt.znet.pc -> comp.sys.atari.znet (moderated) - Znet online magazine
alt.znet.aeo -> comp.sys.atari.aeo (moderated) - Atari Online Explorer Mag
alt.znet.fnet -> comp.sys.atari.fnet (unmoderated) - Atari Fidonet gateway

Alternatively, if there is insufficient interest in doing this, I propose
creation of an alt.sys.atari.* area.

This proposal has not been crossposted to news.groups or alt.config, as
I wish to gauge the response to the proposal from atari users.

If the current users of Atari groups are in agreement, this change would
take place early in 1993. Official proposals will now have to wait until
January 1993 as the moderator of news.announce.newsgroups has gone on
vacation. (Or is about to)

For this proposal to succeed, it will take the agreement of the majority
of Atari users.

OK People - the proposal is there, how do YOU feel about the creation of
these groups?

Either post here, or email to: atari@dogbox.acme.gen.nz

>all the re-wiring, (expensive) cables, floppy&HD placement... Yack...

Admittedly, the last time I saw the insides of a Mega ST was over a
year ago when Dave Small and I demonstrated the SST030 board at the
Detroit/Windsor Atari Fest, but my impression was that the board was
quite similar in size to a full size '386 motherboard...

I have a nice little mini-tower PC case right here ($69 including a
200 watt powersupply) that would almost hold my full sized 520 ST
motherboard.. I was assuming that the Mega ST board would fit inside
quite easily.

Obviously all the connectors on the boards would have to be desoldered and
moved to the back of the case, and probably new openings cut in the metal
case to fit them, but the disk drives should fit in the pc bays easily
enough, and there should be plenty of room for host adapter boards
(although again, the mounting points might be a problem).

From the sound of your message though, it appears that you've already
tried this modification, so if that's the case, I'll defer to your
experience... (but I still think that if I could find a *cheap* Mega,
I might just give it a shot..)

>Who the heck cares if a piece of software comes from a "big name
>company"??

Interesting attitude, but not one which will sell very many
computers.

Computer geeks will buy programs no one else has ever heard of, with
names like Kspread and X-act, but real people want something they've
heard of before. If your computer doesn't have anything available
like that, you won't sell your computer... except to other computer
geeks..

And Atari needs to sell computers to real people... us geeks already
own their products.

Message-ID: <1f78jdINNlru@golem.wcc.govt.nz>
Source record: 214246

I have just uploaded hispeed.lzh, a lh5 type archive to
the New directory on A.A...

This includes 3 programs, one to patch Flash 1.6 so that RTS/CTS
flow control works..

HS_FIX Version 1.0, this patches TOS so that the RTS/CTS now works,
it also has a option in the program to set the RS232 buffers, but
you have to patch a string inside the program for that,
there is a text string I/O-buf:00/00 KB

just change the 00/00's to the size of the buffer you need, max 32k,
the fist 00/ is for the input buffer and the /00 is for the output buffer..

Use any good binary file editor, even the old Dust will do, the string is at
the start of the program just after the branch ins..

so I/O-buf:05/05 KB will set both input/output buffers to 5k bytes..

and a version for Megas STE's for 16 mhz..

plus a program to set up HS modems....

BobR, one of the chaps here rang Silica Shop in the U.K last Friday,
they would be one of the bigest Atari dealers in the U.K. but they
are hoping, but not to well that they might get Falcons in December...

So why are people posting lyes that they have Falcons in the U.K,
I have been told that we all will have to wait till March next year...

afonseca@terapin.com (Alberto Fonseca) writes:
: I'm somewhat insecure as to how the Falcon will be supported by ATARI Corp.
: after its realeased to the general public and at our local dealers... I feel
: that ATARI is really playing a cruel joke with us.. I just heard
: that FSM GDOS
: was discontinued because SpedoGdos or whatever its called, *WILL BE
: OUT* soon.
: Geez.. What about the people that invested in FSM GDOS programs? I
: really hate
: the way ATARI makes new computers and doesn't give you the capability to
: upgrade to the new system.. Example: IBM 386, you can upgrade to a 486...
: Can I, an ATARI 1040 STE user upgrade to a TT030? To a Falcon 030? I don't
: think so..
:
Yes you can, I've done it. It was even easier if I would be upgrading
386 to 486. What's the problem here?

: Will ATARI Corp. make the Falcon 030 and then an 040 in a mini-tower with new
: addon cards that I won't be able to use if I buy a Falcon 030? Then they'll
: say, buy an 040..
:
Possible, so I would by 040. There is no reason to live atari-line
'cause you don't like atari corp. policy: just like the computer they
do.

: I don't know, I'm getting frustrated.. I will take a look at the 030 and
: compare it to a 486, sorta within the same price range.. I think I'm
: confused.. Any help is appreciated.

I've done this too. But, when I look what 486 really can give me what
TT030 can't, I'm happy again. Don't like windog-programs,
brain-damaged memory architecture, etc. Easier to use TT, I've no time
to use 60% of my work time to look after the damn computer!

k>versions? Is it possible, in principle, to write an AUTO folder
k>program for existing Ataris that implement such a virtual FPU?

It is possible, there even are sources on how to emulate a 68881 available at
Motorola.
It even is possible on machines that use LineF for the operating system, as TOS
1.00 to 1.04 do, because an interrupt routine can distinguish between OS LineF
and FPU LineF without problems.

Such a program would have to:

Emulate the 68881 if there's none in the machine
AND do the following things on machines w/ coprocessor:

68000-based machines (STs, that is)
- catch LineF and serve the register-based 68881

68020-based machines (do they exist?)
and 68030-based machines
- nothing

68040 based machines
- emulate the few FPU commands that are no longer integrated
in the FPU. (sin, cos...)

As I said, there are emulation sources available, and a LineF server for STs w/
coprocessor has already been published in german magazine c't long ago.

Who throws these things together to form a nice small AUTO folder thingie?

That's pretty good for a 16mhz 68030.

I wonder why the 68040 running at 28Mhz provides only 22.0 MIPS (3.75 Mflops)
at 33Mhz provides over 25.3 MIPS....

>Anybody know any reason why my old host adapter SHOULDN'T be working with
>my Maxtor/Syquest combo?

Well, you didn't say what drive you run with your Syquest. With my ancient ICD HA, I had to add new Roms to get iot to talk to a Syquest. While ICD wasn't rude on the phone, I was a bit upset that a): they wouldn't ship just the Roms, so I had to buy Cleanup to make up a minimum order, and the version of Cleanup they shipped was older than the one on my local dealer's shelf, and b): They told me the Roms were socketed, which they weren't.
Also, this was while I was running an MFM drive. Later, I upgraded to a Quantum 52 lps, and sure enough, I had to get a new host adapter to make it work. Even with the new Roms, the old HA would not recognise the Quantum. I beleive the Maxtor is even newer than the Quantum, so the same problem may apply.

The answer is simple. The ST Format figures are not accurate. Those
figures place it in the SPARC speed range which we all know is completely
ridiculous. 30-35 mips indeed...haha.

>The correct Usenet-Adress would be: Lars-Thorsten_Sudmann@rs.maus.de

Well... according to John Barger of GFA Software Technologies in Salem, Massachusetts, the Richter company did _not_ procure the rights to the Atari version of GFA BASIC. The word, from this side of the pond, anyway, is that Richter will be doing some developmental work for the fabled version 4.0 but GFA Systemtechnik still owns the rights and furthermore, version 3.7 of GFA for the Atari is due out "RSN."

Personally, I don't care WHO owns it, as long as they continue development and support of the Atari platform!

Is it rediculous? Or are you happy comparing apples and oranges and
just simply looking for another excuse to make a noise about how bad
Atari stuff is?

It's simple market advertising. CPU + DSP = 30-35MIPS.
(I do find that "range" a bit misleading :-))

Sun counts each CPU for MIPS... What's the difference with the Falcon?
Oh, the DSP isn't the same as the main CPU.

It's still marketing. It's still MIPS. Although this does put a new
twist on "Meaningless Instructions Per Second." ...

>Is this a known problem? It seems to be loading okayishly, but the screens
>are scrambled, and it bombs eventually (2 or 3, can't remember offhand)

CyberDrome will run just fine on a TT but you must first change the filename from ACC to PRG. You can then load and run it from a hard disk, if you wish. CyberDrome is very sensitive to things like screen accelerators which will trash the graphics so make sure you boot from a "clean" system. By the way, the ACC scheme was just a way to insure that CyberDrome can autobooot and grab all the memory possible... important on a "small" 1Mb system. :)

Another thought is that this may be one of the very early demos. We should have a new demo available sometime next week. If some kind soul would volunteer to upload it to a.a for me I'll mail them a disk and be most appreciative.

> just simply looking for another excuse to make a noise about how bad
> Atari stuff is?

No, but it is ridiculous. There will be no comparison between a un*x
workstation and an Atari Falcon 030. The operating system will be
running on a 3-5 MIPS chip. Adding 30 MIPS because of a DSP chip does
not make sense. I'm the last person people would call an Atari-basher
(ask my friends :-), but lets be realistic, huh ?

[stuff deleted]

> Sun counts each CPU for MIPS... What's the difference with the Falcon?
> Oh, the DSP isn't the same as the main CPU.

The difference is that any program can be run on each of those CPU's,
and in fact the operating sytstem particularly supports multi-threaded
operation (vital for multi-processor architectures). Yes I know MiNT
does as well, but not in the same context. I can't run 'ls' on the
DSP because the 030 is working out which window to draw next.

>Atari stuff is?

Yes, it is completely ridiculous. The Falcon manual lists the 16 MHz 68030 at 3.84 MIPS in one of the appendices. The DSP is 16 MIPS at 32 MHz. There you go, not even 20 MIPS, tops. Of course, MIPS isn't the full story for the DSP; since it has a highly parallelized internal architecture it can actually perform 3 operations per cycle, yielding 96 a figure of 96 MOPS. Typically this means a multiply and an add with an independent data movement (load, store, register-register, etc.).

From: elvis@watserv.ucr.edu
Message-ID: <24108@galaxy.ucr.edu>
Source record: 214169

Hi,
I was looking through an add in AtariUser yesterday and I saw a listing for something called TAB, and I believe it said after it Tos Adapter Board. The price listed was 84.99 with ROMS. Has anyone heard of this board or know of a review somewhere? Is it like the TEC board? Any replies would be appreciated.

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

Please, *PLEASE* note that this is NOT ME. Ever net.deal I've ever done
(both buying and selling) has come off rather smoothly, except for
a bit of delay with one deal, which was entirely my fault, and the
buyer didn't even mind terribly. I *do* wish you'd post the address
of the 'other' Chris Williams, instead of not telling us who he is.
[It's CERTAINLY not me! the only Atari equipment *I* have is an
old Atari 400 (which, btw, if you're interested, send mail)]. IMHO,
it's just not fair to _me_. There are several of us Chris Williams'
out on the net (one in the UK, one on the east coast somewhere, I think,
and now this one (and me)). It's not fair to ANYBODY named 'Chris
Williams'.

Thank you,
-cgw-

That simply isn't true. You can upgrade a Mac/PC usually with a motherboard swap. Many PC companies now either have the processor in a ZIF socket (so you can plug in a higher powered processor), the processor on a daughter-board or card (so you can pop in your upgrade card) or offer an overdrive socket (you plug in your overdrive chip for ~70% more horses).

An Atari owner can bypass the idiots in Sunnyvale altogether and buy a 68030 board from Dave Small. At least they know they will be supported in the future. I'm not sure what Gadgets have in store as far as a 68040 board goes.

And Ed, why don't you tell us why it isn't cost effective to make a system upgradable? It would seem that many manufacturers either (A) don't agree with you or (B) did it anyway because that is what the market is dictating. In Atari's case, I think it is neither... just a short-sighted strategy designed to push out more machines.

OK, we all know that I turned in my Atari pom poms long ago, however,
I don't think I exaggerated at all. The 30-35 mip figure is completely
out of the ballpark...not even remotely close. If I had to guess
(which I am doing) I would say that it is off by almost an order of
magnitude. The 68030 is certainly a fine chip, but at 16mhz it is
no screamer.

6118. Ghostscript 2.52, gemGS 1.3 on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-11-29 05:59:54 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <84455@ut-emx.uucp>
Source record: 214178

The executables and atari sources for Ghostscript 2.52 and gemGS 1.3 have been uploaded to atari.archive. They should show up in the Gnustuff/Tos/Ghostscript directory someday soon.

The screen driver in GS has (pseudo-working) code for 8-bit color, but I don't have the hardware to debug it myself. Any input from people with 8-bit hardware is welcome.

Gemgs 1.3 has a new menu for the page size option of GS 2.52.

Actually the "Lorraine" was the designation for the early prototype system
board used in the "Black Box" developer systems. I'm not sure of the exact
dates, but this was only in developer hands while Apple was shipping]
productions Lisa systems (or at least trying to find customers wiling to
buy them for > $10K).

That's always struck me as one of the most laughable things imaginable. What else is there to the computer besides the motherboard? Here, keep your case and power supply and keyboard, but we'll just swap out all the guts that actually make up the computer. Look, if you consider that a valid upgrade path then take a second look at Atari: The Falcon is released in a 1040STe case. All it would take to turn a 520, 1040 or STe into a Falcon is a mere motherboard swap. There ya go, and you said Atari didn't provide you with an upgrade path. Geeze, man, the reality is that Apple and the clonemakers sell you a story that they're giving you an upgrade path, but it's a totally ludicrous path!

>Many PC companies now either have the processor in a ZIF socket
>(so you can plug in a higher powered processor), the processor on a daughter-
>board or card (so you can pop in your upgrade card) or offer an overdrive
>socket (you plug in your overdrive chip for ~70% more horses).

There's no such thing as magic, even in computer technology or PC-clones. When you have a machine with "upgradeability built-in" what that means is you've paid more for a system that has a crippled processor, and you'll pay more yet again to put in the processor that was originally spec'd for the system. Or you're putting an over-clocked processor into a slower bus, just like plugging a 16 MHz 68000 straight into a stock ST. Except that with the ST, folks tend to be honest and tell you "you're nuts if you expect to see any improvement without using a cache." Or better yet, you're buying a 486SX with "built-in upgradeability" (read "486 with intentionally disabled FPU so we can get you to buy a brand new 486 chip again later..."). All of that upgradeability hype is pure crap. If the machine can run the bus at 33 MHZ then it should have come with a 33 MHz processor. If you later pop in a 66 MHz "clock-doubler" processor all you'll do is speed up internal operations. Without a cache that will mean a 5-10% speedup at best; with a cache that could get you as good as 30-40%. If you can plug an "upgrade board" into your machine and get 100% faster performance that means your original configuration was an intentionally crippled lemon. Plain and simple.

Y'know Chris, despite your other biting comments and such in this group,
I've always figured you to be pretty insightful in your postings. This time,
however, if you've really bought this upgradability story that you seem to be
endorsing, I think you've just swallowed a line...

I can't say "anyone with half a brain would know better" because there
are a lot of people with full mental faculties who obviously *don't*
know better. Folks who obviously haven't taken the time to reason things
out...

Well, you has to do some slight modifications to the case too, the STE and Falcon has the habit of having more ports than an old STfm... :)

From: Ralf_Czekalla@st.maus.de
Message-ID: <A5151@ST.maus.de>
Source record: 213988

m>Another comment on an Atari "200", yes, in Europe there was a
m>260ST. In 1983-84 before the ST line was released, Atari had a
m>center pull-out in the Atari magazines back then introducing the
m>130 and 260STs with 128k and 256k respectively.

There has never been a 256kByte ST named 260ST. When I got that 260ST in winter 1985 it had 512k, disk-boot-ROMs like the 520ST but was available as a nonbundle. It would be impossible to work on these 256k machines when you must even load a disk-TOS and then install the 128k(4*32k) Screenbuffer. When you add this you get 192+128 = 320kByte. So it would be even impossible to boot the system completely - the same thing as in a 1Meg Falcon030 in 64k-HiCol.

On the CeBIT 1985 - oh it's so long ago - some of the Atari-crow annonced a ST-version with 256k, but they never released it, because it would not opperate.

And the 130ST you mentioned, was a Atari 130XE/XL - a 6502-based Atari as a follow of the 800XL - shown on that '85 CeBIT too.

Assuming that the problem is not due to your configuration of the drives (SCSI address, parity, terminators), it is possible that some older hostadapters don't work. I had this problem with my GE Soft III adapter, which failed to work when I upgraded to a 210 megabyte Maxtor; I had to update to the GE Soft IV, which worked fine.

It _is_ utterly ridiculous.

> It's simple market advertising. CPU + DSP = 30-35MIPS.
> (I do find that "range" a bit misleading :-))

Even with the DSP added in, it doesn't add up to 30 to 35 MIPS. In the ideal case, the DSP can handle 15 MIPS or thereabouts, and that's only for programs and data in its own RAM (96K). In practice, neither the DSP nor the 68030 will be running at full speed, largely because the CPU shares RAM with video (which slows it down) and the DSP needs data from main RAM, which comes through the 68030. I think 2 to 3 MIPS would be a better estimate of the Falcon's performance. But then again...

> It's still marketing. It's still MIPS. Although this does put a new

I doubt that it can be much of a pain to put the mega boards in full
tower cases. I put my LARGE 1040 ST board in a tower case, together
with a 50 meg drive, a DD DS floppy, and a four-meg RAM upgrade. I ood
used inexpensive ribbon cable to run the original (I desoldered them)
plugs and sockets out to the backplate, and I bought ONE new cable--
$ 4.99, a universal joystick extension which I used for my detached
keyboard (the original keyboard mounted in the original 1040 plastic
case, suitably cropped. Now I have a very reliable power supply, and
the (admittedly) ludicrous size of the box is unimportant because it
stands on the floor by itself. The floppy and hard drives slipped
neatly into the standard bays, and I rewired the rear reset so that
it is now controlled by the friendly front-mounted tower reset switch.
All in all, it is about as cheap as making your own external hard
drive unit, and only a bit more work! But Falcons weren't available
when I put that unit together. . . .

If what you're saying is what I think you're saying then each application
running could install it's icons on a generic desktop... Does that mean
e.g. 3 dustbins and 15+ filing cabinets to choose from when you try to
use the icons from just one of the applications you have running?
If you're going to start blinking the icons on and off when you're actively
using an application, why not just flip the desktop as well?

s>But the is another way, its a File called HISPEED, it has a program
s>to patch Flash, so that RTS/CTS flow control works...

I don't know which program is included in that particular file, but there is one that works great and does even more than fixing RTS/CTS. It is called FLASH-Patch V2.0 and was written by Juergen_Meyer@hh2.maus.de. You can alter Flash in four ways:

(1) Make Flash use RTS/CTS.
(2) Tell Flash to enable RTS on startup (there's supposed to be a fax program that disables RTS, making it impossible to access the modem).
(3) Keep Flash from installing its own RS 232 receive-buffer-full routine. I used to have a lot of trouble downloading (14400 Baud), now all my problems are history.
(4) Change Flash into a terminal program that uses MIDI for I/O.

Greets, Matt

>supported in the future. I'm not sure what Gadgets have in store
>as far as a 68040 board goes.

I'm not so sure Dave is doing any better than "the idiots in Sunnyvale" in the support department. How often does Dave Small get on GEnie as opposed to Bob Brodie? I get people all the time asking me, "What's up with Dave Small, what's up with Dave Small?"

As for 68040 boards, I seriously doubt Dave (and George) have been thinking about them much. I wouldn't be surprised if Jim Allen has something up his sleeve. But at the Dusseldorf show, there was only one (prototype) 68040 board there, from what I hear from this net, so I wouldn't expect one on the market anytime soon. Atari's Falcon will be out before a 68040 board will; at least I hope the machine will be out before then. :^)

j>520 came. Can anyone fill out or rule out anything of this ?

No! They had 512 KB from the very beginning. The only difference was in
packaging: The 520 came with ROM TOS and bundled with monitor and disk drive,
and the 260 could be purchased alone and came with TV cable (SCART connector)
and disk basedTOS only.

Just as a trivial side-note, I was doing some research on our schools Computer Select CD-ROM system (collection of computer magazine articles) and saw that Atari and CBM are both losing aproximately the same amount of money per quarter. Atari is progressively losing less and less money though. Maybe the same for CBM. CBM's loss figures were, on the average, less than ATari's though.

Also, as of this weekend of November 27, Atari has NO stores selling ANY of their products in Columbus, Ohio -- population, over 2,000,000.

This was not the case until a few months ago. 8-(

Pretty soon I need to set up a bulletin board system for a project that I am working on. I have downloaded two public domain BBS programs called "stadel" and "minibbs", but am also interested in purchasing a multifeature BBS.

My requirements aren't that great: All I need to have is user password protection, the ability to send/receive mail between users, and it would be nice to support Kermit, X/Y/Z modem downloads. Other than that I don't have any real specifications. Users will be dialing into this BBS with Macs and IBM's, if that makes any difference with the software.

Thanks in advance for any info on BBS systems!

Thanks,

Perry Pederson

6140. music on atari (summary) (longish)

Newsgroup: comp.sys.atari.st
Date: 1992-11-30 00:14:46 UTC
From: map@cs.brown.edu
Message-ID: <1fbmdmINNgit@cat.cis.Brown.EDU>
Source record: 214191

hello again.

a while back i inquired about buying an inexpensive old atari solely
for the purpose of making music. i received a number of helpful and informative
replies and thought it was only just that i try to summarize this information
back to the net.

thanks to:
Brain Rost (rost@tecrus.enet.dec.com rost@rgb.enet.dec.com)
Forrest Chang (chang@adelphi-assb01.army.mil)
Chris Herborth (herborth@pinot.waterloo.NCR.COM)
Russ Evans (e_gs18@unixb.nerc-murchison.ac.uk)
Ton Koelman (koelman@stc.nato.int)
Dave Wade (DAVEW@D.SSS.CO.UK)

---

to clarify what (i think) i'd like to do with a computer for music:

hmm. thanks for all the advice. what i'd really like to do - and i don't
know how feasible this is, particularly within a budget - is do everything
in recording music from the computer. i'd like to be able to sample sounds
(whether interesting voice samples or drum sample or whatever). i'd also
like to be able to create good synthesized voices and perhaps use existing
sound libraries (particularly for percussion). then i'd like to be able to
create drum tracks on the computer by specifying patterns of these
available sounds, just as if i were programming my drum machine. then be
able to compose melody tracks, still using online sounds. then add in
samples. and do things like rearrange, move things around, cut, copy,
paste, stretch and compress things, put effects on them and have the whole
thing defined online. then i hook up a stereo out from my computer to a
tape deck and hit play. voila, a song on tape. notice this shouldn't
require i necessarily have enough hard disk space to store every second of
music. i should be able to specify a drum track and some sounds, hit play,
and then it will retrieve them and play them without having to save the
piece to disk before saving it to tape. i don't know how possible all this
is, or how affordable if possible. that's what i want though. :)

---

hardware:

summary: old ataris are inexpensive and easy to find and can do an awful
lot. but there are limitations, particularly in the line of sound quality,
as for sampling.

comments:

You can get an Atari computer with monitor for $250-350 used. Since MIDI is built into the computer, that's all the hardware you'll need.

A few weeks ago, someone was dumping a 520 ST for (get this!) $75 US. Yup, that's right, less than $100 for a .5M computer with MIDI ports, etc built in. There's no way you could get a klone that cheaply...

Sampling requires some external hardware as well as software. The cheapest commercial packages run about $75. Sample *playback* is possible with PD software and many PD samples are available.

If sampling, or direct to disk is in your goals, you might want to wait for the Falcon which supports direct to disk in stereo out of the box, and 8 track with external hardware. I'll be keeping an eye out for this myself.

Me -- I bought a Mac, as I have plans to do some heavy work!

Do keep an eye out for the falcon, as it will be cheap, supposedly is _very_ backwards compatible with the ST and has much more potential...

I hate to be a damp squib, but I suspect that these days you might be able to do nearly as well with a PC Clone and a sound blaster card. The main problem is that samples tend to be large so you will almost certainly need more that 1/2 Meg of memory. You will also find a hard disk very usefull. Plus a proper monitor <either MONO or Colour>.... Then you will need a sampling cartridge.

The following is my *opinion*: Atari is fading as a platform, but its one strong remaining niche is MIDI. You cannot do MIDI with any other PC as easily or inexpensively as on a used Atari. If you can dedicate the machine to just MIDI, it's a real good way to go.

---

software:

summary: again, plenty is available free in PD. but it's not too hard to hit the limits of what's available. for a little money, there seem to be plenty of options in packages to buy.

comments:

For software: There are a few PD sequencers out there. Alchimie Jr. is one I tried that looks nice but was buggy anmd crashed on me. EKSEQ and the Cosh sequencer from the UK are better. But commercial packages are so cheap these days (for $100 you can buy Dr. T's Tiger Cub, which even prints out sheet music!), I'd go that way myself. If you're really strapped for $$, buy used, I got Master Tracks Pro for $75 (new is about $250).

Patch editing and librarian programs are pretty common. Over the years I've used ones for a number of synths. You can easily come up with a synth that has no PD librarian support, but a large number do. There are also "generic" librarian programs that let you store patch banks but not manipulate them.

Sampling requires some external hardware as well as software. The cheapest commercial packages run about $75. Sample *playback* is possible with PD software and many PD samples are available.

You can get by on PD/shareware, but eventually you'll probably want to buy stuff (like if you want to need to FSK or SMPTE sync with real tape -- I do).

The PD stuff for all platforms is really not up to much apart from a quick play, but there are programs in the $50-100 range which are quite reasonable, and the $500 programs for the Atari are about the only serious professional software still maintained for the platform. Consider Sequencer One from Gajits, and Band-in-a-Box. There is some sampling soft- and hard-ware from MicroDeal. The classy stuff is Cubase and Notator.

---

in general:

my impression was that you can do an awful lot with an atari, but, given my vision (see above), i'm deceived if i think i can do what i want inexpensively, on an atari or otherwise. an atari seems to be an excellent companion to an existing hardware studio with synths, samplers, drum machines. whether it's possible to do most or all of your work on any computer is something i'd like to find out. in the meantime, i doubt i'm going to buy any more hardware until i understand things better.
perhaps i and others interested in music should wait and check out the falcon.

comments:

For sampling, etc. the ST is not as well suited as a PC with a sound board or an Amiga. The Falcon, which is the newest Atari (due to ship in December) would be better, but at lots more $$ ($800-1300 new depending on memory config)...it even has direct-to-hard disk digital recording software bundled with it! My feeling is that for sound generation, the STs are not that good, you're better off with external synths. The (newer) STe models have better audio, they have stereo D/A outs; if you can get one of these it'll be better suited to sampling applications.

For a budget, What you want is pretty much impossible. I think everything except the computer making all the sounds is possible on a budget. I am assuming that u r expecting a certain threshold of quality here. More or less what you are describing is possible by sound/noisetracker sort of programs. Unfortunately these are limited by 4 tracks and sound quality, 8 bit sound.

The sampling stuff I've seen, doesn't really make your computer into an all purpose sample, i.e. like an akai or ensoniq. They give you sampling ability but not with very much flexibility. Seems like the optimal platform for what you want to do is the falcon (with the built in DSP). If atari can get it out the door, keep the optimistic (thus far) developers interested, then that would be the way to go. I think people have bought NeXT machine (the other much

more expensive computer w/DSP) to do what you are saying. As far
as I know, nothing does what you want that you could afford. If
you're a talented and high output producing coder, maybe you can buy it
yourself.

Sorry Howard.. sounds like YOU've bought into the "anything that doesn't say Atari on it has to be crap" line..

Here's a "laughable" upgrade scenario for you..

I can take my 12mhz Turbo XT, pull all the cards, yank the motherboard, and for $185 I can slip in a 33Mhz 80386DX motherboard with 64K of cache on board.

ALL the peripheral cards just pop back into their slots, the motherboard lines up with all the case openings (ie: I don't have to hack the case to make the upgrade fit).

OK, sure it's still got an 8bit MFM drive controller.. the point is that I *can* upgrade to an IDE or SCSI controller LATER, when I've got the cash.. and when I do upgrade the drive and controller, I don't have to hack and slash to get it to fit, or work.

If an Atari owner CAN'T afford a TT or Falcon, he CAN'T upgrade his computer (other than the "hack and slash" method).

BobR

>with their own desktop will cope.

Um, am I the only one out here thinking Degas Elite? Crack-Art? CyberPaint? All the best paint programs for the Atari work on full screens. Now maybe I'm confused an I'm missing something here, but won't these programs have problems with MultiTOS as well? If so, we'll be losing some of the staples of the ST software repertoire.

I think that the user should be able to run a full screen program in a window on MultiTOS. If you wan't to be REALLY clever, let the window be a window onto a screen-sized area that the program could work on. Then the user could scroll the window and scroll around the screen.

Oh, and while we're on the subject of MultiTOS and compatibility with old ST programs, there was some discussion about programs that run just from a Dialog Box, with no windows, menus, etc. These will have problems with MultiTOS because the dialog will hold up the system and you won't be able to select any other applications. Why can't the dialog code (form_do) be rewritten to behave (as far as the graphical system is concerned) like a window? It would be just like on X-Windows or the NeXT where a dialog box can be moved around the screen, pulled to the front or placed behind other windows, etc. I don't know what implementational difficulties this would present, but it seems ideal from a user's standpoint.

Just my $.02.

Graphically Carrier Command is excellent! The gameplay is suitably involved - but don't buy it for fast-action gameplay. Even the 'action' mode is very strategic & the whole thing is real time. (e.g. travelling time takes almost as long as it should!)

Gunship is very involved, but I found it too slow, and the graphics were a bit kludgy. The control method is also not the easiest! (But most chopper sim's are pretty complex)
However, it's suitably realistic, and the graphics are pretty detailed (probably explaining the speed loss) - although the choice of colors could have been better!

So what you're saying is you wish Atari would make an ST motherboard that didn't have two MIDI ports onboard, onboard DSP, onboard SCSI-2, onboard RS-232 and Centronics ports, onboard high-speed serial port, onboard joystick/analog ports, onboard digital stereo audio, or onboard graphics system. You'd rather Atari made a motherboard that just had a CPU, some RAM, and some slots, so you can go out and buy all those options separately, and have the privilege of buying software that may or may not work with your particular brand or model of hard drive controller, floppy controller, video system, audio system, serial port, printer port, joystick port, etc. ad absurdum. You're demanding your right to use bass-ackward disk-controller technology and enjoy sub-megabyte/sec disk and overall system throughput. You want to experience the thrill of configuring a passel of cards with conflicting interrupt vectors and control addresses. Fine...

What you want is obviously not what Atari makes. Hey, if you like Intel-based architectures, go ahead and buy 'em and use 'em. Or if you just want that ability to start with a bare-bones system and pick your own expansions, but ya wanna stay 680x0, go thru a VME product catalog. Buy

a chassis, buy any of a number of 680x0-based single-board computers, pick out your favorite network, terminal, and graphics interface, pick out an operating system. Toss the old CPU board when Motorola introduces a new processor, keep your other cards, just like that PC system. Dunno if your OS device drivers will need any new work, ya never know.
>
>If an Atari owner CAN'T afford a TT or Falcon, he CAN'T upgrade
>his computer (other than the "hack and slash" method).

And if an IBM PS2/25 owner can't afford a Model 50, he CAN'T upgrade his computer. And if an Apple Mac Classic owner can't afford a //fx or a Quadra, he CAN'T upgrade his computer. If an Amiga 600 owner can't afford an A4000, he's stuck. What is so different about the Atari situation from anyone else's? (Not saying that "just because everyone else does this makes it OK," just asking, why are you singling out Atari on this issue?)

That $185 for a 386 motherboard is an interesting figure. Competition has driven the price of clone components to artificially low levels, and a lot of companies are going out of business now because they haven't been selling at enough profit to stay afloat. That market is bound to recoil hard in the opposite direction as more companies are weeded out, and only the most flexible groups remain. I suppose consumers are winning in the meantime, but the situation won't last forever. It would certainly be nice if some other companies reverse-engineered some Motorola processors and started selling clone chips for cheap. But I figure if it were easy to do, someone would have done it by now. As it is, the rapidity with which x86 clones are introduced is a testament to the sophistication of the architecture...

I had the same problem, Cheeta screwed up my harddisk pretty bad, but I managed to fix it, with no loss of files... BTW, that is the latest version of TOOLKIT? My version works good as long it is no errors on the HD or bad sectors. It would be nice to have a full working version...

I think you will find that its a miss-print, it should read 3.0 mips,
even the Great Acorn A5000, a real 32 bit RISC machine gives 13-26 mips..

Roger..... sheppard_r@kosmos.wcc.govt.nz

6150. A North American BBS that gets new files regularly?

Newsgroup: comp.sys.atari.st
Date: 1992-11-30 07:24:40 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.ZYr4yhx8N6Y@elfhaven.ersys.edmonton.ab.ca>
Source record: 213995

Could someone tell me of a BBS in North America that:

1) Gets new files regularly.
2) Accepts LD callers.
3) Supports 9600/14400 BPS.

I do not have access to FTP, BART, or atari.archive.umich.edu which is why
I am asking. Also (perhaps this is a pipe dream) it would be even better if
the BBS in question did not have an access fee.

To avoid wasting bandwith (any more than I have) I'll keep this short.

I should suggest QBBS or Ratsoft. If you want to have Fidoaccess youre stuck
with QBBS, since RatSoft (as far as I know) doesn't support Fido yet. Another
option is a rather new swedish boardsystem called ZeBra but it is
still under developement... I think that RatSoft comes from USA, QBBS ST comes
from Holland...

> alt.znet.fnet -> comp.sys.atari.fnet (unmoderated) - Atari Fidonet gateway

I would support such a move for 2 reasons:
1. The Atari population is dwindling and needs to keep together.
2. Our site does not take the alt. hierarchy, so I sometimes get Znet by
email. It would be easier to get it as News.

sound like some extended header from some strange (non-ST) LHArc. Try to add
the "compatible header" switch (-k?) when extracting. On the other hand, the
minilzh hidden inside lharc.ttp could be a good try.

>alt.znet.fnet -> comp.sys.atari.fnet (unmoderated) - Atari Fidonet >gateway

While I don't want to be negative, aren't you bundling two seperarate issues (the magazines & Fidonet) here that might be better keep apart?

As far as the online-magazines go, would the envisaged traffic be worth seperate groups? What's the thoughts on just posting them to c.s.a.st? IMHO, if we're going to go through the RFD/CFV route, we ought to be doing so to create comp.sys.atari.falcon, although I suppose that that combined with comp.sys.atari.online_mags would be my preference.

To clarify, my suggestions are to RFD/CFV comp.sys.atari.falcon to lower the current traffic and then post the online mags to comp.sys.atari.st.

Comments?

>Alternatively, if there is insufficient interest in doing this, I propose >creation of an alt.sys.atari.* area.

Why would these do any better that alt.znet.* ?

You need a GEM resource file editor, such as HiSoft WERCS (I was going to
recommend Kuma K-Resource, but as HiSoft has taken over Kuma's stuff I
expect K-RSC will sink without trace).

>If possible I would prefer to use PD software.

There are (I believe) some PD resource editors on atari.arhcive, but since I
have both WERCS and K-Resource...

> rvenable@helix.nih.gov | -- the Phantom Nerd

The Alt-help thing is done by changing a vector in the low memory system variables -- so that's fairly easy.

Screen savers et al. are considerably harder. For the saver I wrote, I intercepted the keyboard processor interrupt handler. Whenever this handler is called, information from the keyboard or mouse is heading into the ST -- this constitutes "activity". I also intercepted BIOS output calls -- these also constitute "activity".

The countdown-to-blank was done by chaining another interrupt handler onto one of the system timer interrupts (I forget which one). Any "activity" caused the counter to be reset. Yet another interrupt handler on the VBL queue checked for counter=0. When this occurred, the screen saver kicked in until the counter became non zero.

The whole thing was implemented in two parts. An AUTO resident .PRG bit that installed a cookie, which the auto-selecting .ACC or .PRG could pick up. The ACC or PRG would manipulate shared variables to control the PRG bit.

If anyone's interested in the code...

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

All this reminicing about old computers got me thinking about the
"Rumored 64 bit Atari Game Machine" My bet is if this thing ever sees
the light of day it well just be two SLOW 68000s in a box. I really
believe it may come out since Atari Sunnyvale has been advertising in
the paper for 68000 assembly language programmers. Despite the success
Atari is still having in the game field (34% of all Atari sales) they will
probably just use it as a dumping ground for parts that were bought/intended
for ST production, but left over when sales of that machince dropped off.
We'll see when it comes out *IF* it has the same part numbers on the chips,
uses 256k DRAMs, & no surface mount parts. Not that there's anything wrong
with two 68000s in a box running at 8 mHz. It'd compare favorably with the
other stuff it's competing against. & there are a lot of M/L programmers

6170. Z*NET Issue 9220 released into alt.znet.pc

Newsgroup: comp.sys.atari.st
Date: 1992-11-30 18:20:43 UTC
From: jonc@status.gen.nz
Message-ID: <9sg2uB4w165w@status.gen.nz>
Source record: 214109

Hi fellow Atarians,

Issue 9220 of Z*NET Atari International has been posted in alt.znet.pc
for you to read. This week carries alot of news from Bob Brodie and
the release of the FALCON.

Happy reading, and thanks for the email chaps.

Usual notice:

If your site does not carry the alt.znet groups please ask your sysadmin
to get it for you. If they say it is not there tell them their mail site
must have an "X" and to fix it.

Kind regards from the Z*NET CREW worldwide.

Jon Clarke Z*NET Pacific

6171. SALE (CHEAP): 520ST System

Newsgroup: comp.sys.atari.st
Date: 1992-11-30 18:31:39 UTC
From: mcalear@diag.amdahl.com
Message-ID: <d6mL02rd2cnX01@JUTS.ccc.amdahl.com>
Source record: 214118

```
Atari 520 ST System: $500
- 1 Meg RAM
- Atari SS-354 3.5" Floppy Drive - SS :(
- Atari SH-204 20 Meg HD
- Atari SM-124 Hi-Res B/W Monitor
- Atari SC-1224 Color Monitor
- Avatex 1200 baud modem
- Panasonic KX-P1080 dot matrix printer
- Logikhron clock card
- monitor master
- lots of software/games
- all cables, mouse, joysticks, box of manuals

I want to sell the system as a whole unit (I don't want any spare
parts sitting around my apartment). There is quite a bit of stuff to
ship, but I will split the shipping costs with the buyer. Please
contact me via e-mail (which is preferred) or by phone for more info.

e-mail: mcalear@diag.amdahl.com
work: (408) 992-3181
home: (408) 741-3439
```

6172. Re: Falcon with 68882.

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1fdncgINNccb@golem.wcc.govt.nz>
Source record: 214120

No, the Falcon is said to run at 4 Million Instructions per Second, the DSP chip is the one supposed to handle 30-35mips, which is *fast*!

(As long as they can get it going)

>FSM GDOS has been discontinued by Atari. Now they have SpeedoGDOS
>which uses Bitstream's Speedo format outline fonts. Still, SpeedoGDOS won't
>be available for another month or so.

Now this is really annoying. I've had FSM for almost a year, now, and then
Atari goes and changes it. This wouldn't be so bad if I hadn't paid for
an upgrade to FSM and Wordflair II a few months ago (both of wich were
completely useless and I have since gone back to the previous versions).

As an FSM user, I want to see Speedo soon, and I want to see it cheap.
Also, it had better work on a TT (unlike the last release of FSM!).

Sorry about the raving, but I can't help but feel that I've been paying
to be a beta-tester for Atari on this product, and I don't appreciate it.

evansg@uproar.enet.dec.com (Gwyn Evans @ IME) writes:

> To clarify, my suggestions are to RFD/CFV comp.sys.atari.falcon to lower
>the current traffic and then post the online mags to comp.sys.atari.st.

> Comments?

Considering how long it takes to get a group created, I'd say RFD right now,
that way when Atari has Falcons shipping in numbers - and about half the
people in comp.sys.atari.st go out and buy one - there'll be a place for
the discussion to appear. Also, with the interest from NeXT programmers
and other DSP enthusiasts, and the discussion of the machine itself we
see in comp.sys.atari.st, I think it is justified.

>>Alternatively, if there is insufficient interest in doing this, I propose
>>creation of an alt.sys.atari.* area.

BLEAUCH! Atari owners are already though of as Alternative. :-)

> Why would these do any better that alt.znet.* ?

Because "alt.znet.*" doesn't have the word "atari" in it.

>Yes, those were the days.
>
>RandyH

Same here. The main thing I liked about Compute! is it was not computer-specific, unlike a lot of the other magazines of that time. It covered just about any computer that was on the market, even the ones that were in a minority. They covered the TI-99/4A long after TI stopped making them. I had access to many different computers at that time, through many resources (friends and school). I came to like portability in code, because of the fact that Compute! would get one version of a program, and they would make versions of it for all the other computers they covered. I could see what the other computers' strengths and weaknesses were, because of this, and it was interesting to see how different the versions of a program looked on the different computers. I also liked their general coverage of all the different computers. I didn't have to look at lots of different magazines in order to know what was going on with all the different makes.

Probably one of the best Atari 8-bit programs they ever produced was, ironically, the last. It was a screendump program that recognized lots of different formats of graphics file and printed them almost equally well. It was one of their programs that I used the most. I just let my subscription run out when the made the big change, which was in 1988. I was looking forward to the changes because they put them in such glorified terms. They said they had gotten feedback from their reader's survey, which I am sure I participated in, and were ready to make some sweeping changes, "that we're sure you will

enjoy."

I got my next issue and it definitely looked different. The first thing I noticed was the change in graphics on the front cover. There used to be art done by this guy (I forget his name), and it was usually whimsical. I looked through the issue like I usually did. I came to the last pages of the magazine and I was getting this sinking feeling. I did not notice a SINGLE type-in program for any computer!! I looked through the magazine again just to make sure (surely I had missed SOMETHING). I was right the first time. There were no type-in programs. Then I read the editor's column and found out why. They said the majority of their readers were computer users instead of hobbyists, who had no time for or interest in type-in programs, and basically felt they were a waste of space. So to go with the majority, they got rid of their space for type-ins altogether. They said that if you owned a PC, an Amiga, ST, Apple II, or C-64, you could still get type-ins by getting the computer-specific publications they had been putting out for those computers. The unfortunate thing was the first casualty was support for the Atari 8-bit. There was no computer-specific magazine from them that supported it. It was the first time they had abandoned a computer that they used to cover, while that computer was still being made. A year or two later they did the same thing to the ST. They encouraged those people that still wanted type-ins to subscribe to the computer-specific magazine of their choice from Compute!, but still subscribe to the original "Compute! Magazine" which would have general industry news.

I think one of the reasons this happened is it seemed they kept on changing chief editors. I think Charles Brannon was in charge of the magazine for a long time (he may have been a co-founder of it), and he eventually left in 1986 or '87. It was after that that it looked like the magazine started changing quickly, until eventually all unpopular computers have been weeded out of it. It may have been that before, Compute! covered as many computers as possible on principle. They saw the plurality as their strength, drawing in as many readers from as many diverse backgrounds as possible. They have shifted from that to majority rule, it seems, going in favor of the majority at the expense of the minority.

One of the last times I looked they had sections within Compute! for Mac and Amiga. In one issue I saw that the Amiga section was actually bigger than the Mac section. The majority of the magazine was PC stuff. When I've looked most recently, there was no Amiga or Mac section at all, just PC stuff.

Anyway, I even went so far as to write them a letter saying I was very disappointed with their choice. I emphasized that a good part of my interest in computers came from them. I think it was later, when I noticed that their computer-specific publications were disappearing right and left, I wrote them a second letter saying maybe they should bring type-ins back. After all, no other magazine at that time had

type-ins, except the other 8-bit-computer-specific magazines. And how would people learn how to program computers if they wanted to explore that? Type-ins from magazines seemed like such a nice introduction to programming before. There's got to be some people out there interested in such a thing. After all where will the future programmers come from, who will make the software of the future? I don't know if they ever listened to my recommendations seriously. Anyone else know what happened with Compute!? I think all of their computer-specific publications eventually left the scene, and I know they were bought by the publisher of Omni magazine a while back. As far as I know, they've really become just another PC-only magazine.

I used to like them so much because they were diversified, supporting even unpopular computers. Recently they've gone the way of all other computer magazines, going into a specific camp and ignoring everything else.

Actually, I *do* wish someone had reverse-engineered the ST line long ago. If nothing else, it would have given us a much larger installed base of machines for software and hardware developers to sell to, and who knows.. if Atari actually had some competition in their own little pond, maybe they would have had to wake up and DO something, long ago..

A couple of times we heard about "ST clones", but nothing ever came of it... too bad...

(and yes, I wish I had the option of paying for, or not paying for MIDI ports I never use, or a DSP that I most likely won't use.. and yes, I'd like an open architecture so I could upgrade my disk drives without having to hack the machine to death..)

Methinks the 3" LCD screen would make rather a poor device for the family to gather 'round for watching Star Wars!

Competition for the cable system is being tested using CD-I players as the front end (with MPEG for full motion video) with a 1.5Mbit/sec data rate to the player over standard phone lines. Since (hopefully) many homes will have CD-I players within a few years, and these will already be attached to the home's TV and stereo, it makes a logical front end. There is also enough intelligence present that a smart interface to Electronic Yellow Pages or interactive news services would be trivial...

The cable companies are also looking at doing the same thing by using a portion of their bandwidth for sending data digitally rather than the current analog system.

>somewhere...

Yes. It was code named the Amiga Lorraine.

>Did you say Compute! had a coverage on the history of Amiga? Can anyone
>verify it? is anyone willing to sell that issue?? :)

They had some coverage of the history. In one of the issues from 1984
or '83, when they were reporting on a CES show, they had a special
report on a computer from Amiga. They said it was only in
prototype form at that time. They reported that they saw a demo of
all 4,096 colors being displayed at once in its hold-and-modify
mode, and they listened to some samples from its built-in speech
synthesizer. They hailed it as a generational leap, rather than an
evolutionary move, if it came out. Its specs were something like
this: 68000 processor, 512K RAM, 4 sound channels, 4096 color
palette, built-in speech synthesis, a "smoke stack" expansion port (or
something weird like that). I think that was about it at the time.
They didn't talk about what would later become one of the Amiga's
most revered features: Multitasking. I think they said that a
physical computer was not even on display in the booth, because it was
not all together yet, so to speak. It might've been a big pile of
chip boards and wires at that time. All you could see or hear was
from the monitor that was on display.

I have the issue where this article appeared. As a matter of fact I
have all the issues from March 1983, up to some point in 1989, except

for the April 1983 issue. The only other time they talked about the Amiga before it was introduced is when they did a hands-on review of the Amiga 1000 from Commodore in 1985.

Contrary to another claim, I am almost positive they made no mention of Atari having anything to do with Amiga in that article. The story about that, as far as I know, didn't come out until a couple years ago.

>PS: I somehow think Commodore and Atari are in fact the same company... :)

Oooohhh!! That was a low blow!! :-)

>in a window? Isn't that a lot better?

Please PLEase PLEASE! do not do this bit of needing to put the game in
the auto folder! If you do that, you are more than likely killing any chance
of making the game HD loadable. I realize that you _can_ put a game in your
/auto, its just that the thought is not appealing, not to mention a pain in the
butt to change to a normal boot sequence.

I personally like the idea of having a key-sequence to toggle between
full-screen for top window/process and normall completely windowed environment.

============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
```

comp.sources.atari.st ! uuencoded/shar sources

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4
Access denied.....-36.....5
Invalid handle.....-37.....6
Insufficient memory.....-39.....8
Invalid memory block address...-40.....9
Invalid drive specified.....-46.....15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

What is Free-Net and how can I get access?
==

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

CIS e-mail : internet>aa338@Cleveland.Freenet.edu

:MAGS:
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany, Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

START, published by Divo , M. Gijzenburg 14, 2907 HG Capelle a/d IJssel
---
cover price: fl 7,50 (may be more now)
All round magazine, floppy-service available for published programs.
68 pages. 2 color print

6 publications a year. One year subscription fl 39,95
including floppydisk fl 119,95

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number
of reasons. An example is this: say D:\BLAH.ARC is a file you would
like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then

hold the right button while double-clicking ARC.TTP in an inactive window.
(I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can
also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:COMP:
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

WEL Welcome to comp.sys.atari.st
ARCS How do I deal with Archived files (.ZOO, .ARC, .LZH)?
*MSA Some info on Magic Shadow Archiver
CLI What Command Line Interpreters are available?
ERR What does TOS ERROR nn mean?
GDOS What is GDOS, and where can I get it?
GNU What GNU software is available for the ST?
HAM Where can I find Ham Radio software for the ST?
LANG Public Domain/Shareware languages...
MINIX Is MINIX available on the Atari ST?

FTP Anonymous FTP servers
TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:MSA:
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work, cherborth@semprini.tdkcs.waterloo.on.ca at home, C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI:
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST. Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12

```
Write protect..................-13
Media change...................-14
Unknown device.................-15
Bad sectors on format..........-16
Insert other disk..............-17
Invalid function number.........-32.............1
File not found.................-33.............2
Path not found.................-34.............3
No handles left................-35.............4
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

:GDOS:
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
====================================

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar

package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN:
Is there a version of XWindows for the ST?
==========

Currently, there is no XWindows port for the ST. It is quite unlikely that there will be one, although you are free to port it if you like :-). There does exist a port for the TT (and presumably Falcon) as part of Atari's Unix distribution.

:DEMOS:
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL:
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a

help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

Later,
Steven Ourada

UPGRADE Can/should I upgrade my ST?

:WEL:
Welcome to comp.sys.atari.st
==========

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:FALCON:
What are the specs on the Falcon?

==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

Distribution is beginning soon in Europe, and by late October in North
America

:ACCEL:
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

```
-------------- ----------- ------------ ----------
| MFM drive |------->|ACB 4000 |------>| ICD |------>| ST DMA |
-------------- ----------- ------------ ----------
```

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put the drive internally, you will need a case with power supply to house the adapter and hard drive. IBM case is very easy to get and has a lot of space for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive they use about 20 watts or less, Quantum LPS drive use about 10 watts each, make sure your power supply has more than the drives need. Again if you use IBM case, the 150 watts power supply for that type case can drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup
SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL), it's 50pins IDC female connector on each end with 50 conductors cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by Ben Gilbert
and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome

* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a SM 124
is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can use
your old monitor, but it only works in the TTs five color modes
(3 ST-compatible modes, 2 TT-modes). Resolutions are variable, ask
OverScan about the values for your monitor.
Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style
joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of
time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable
units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and

the excessive use of disk accesses in Mac software will have you wanting
a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File
Exchange if you are needing MS-DOS data disks for Mac work. Language
configuration support, keyboard support, A4 paper size support for
Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a
MacIntosh with a decent screen is indescribable. The extra flexibility
that you get will also make you feel more confident in the greatness of
your Atari. You will also get to see some of the frustrations with one
of the other sides of the fence - frustrations like excessive disk access,
remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating
philosophies of an ST and of a MacIntosh. You really must read the
documentation that comes with the Spectre GCR (and I for one found that
a real delight. Dave and Sandy have a very different approach to software
documentation that makes it enjoyable reading.) You should also read the
Mac Operating System docs. One other reference you may need if you are
going to do much with Mac software is one of the reference manuals
referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on
a GCR, don't figure you will get a straight answer. They won't know.
The current compatibility list from Gadgets lists about 450 programs
and their release numbers that have been tried and found to work with
Spectre GCR. In general, if a piece of software won't work with the GCR,
it is probably becuase of copy protection. Most serious Mac software is
not copy protected.

One last note - earlier versions of the emulator exist that were not capable
of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from
Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64
KB ROM which is not good) to fully utilize the device. Also it's recommanded
to use it with MONO monitor and at least 2MB RAM. The Spectre software takes
about 300 some KB of memory, so on a 1040 there is not very much left for Mac,
especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most
Mac drive is double side). With DOS mounter or software like that you can read
/write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM
binary. It's only for file transfer). Or you can use Apple File Exchange to
read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not
run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

I think we as Atari users need to get a grip on the fact that the majority of people using computers are computer users, not hackers, not programmers, not "hobbyists." However you choose to look at this fact, approvingly or otherwise, we have to acknowledge that computer users have the most buying power. Like many other products that build up a reputation, people are going to go buy what they know or hear about from friends or TV ads. There are lots of TV ads these days for 386s and 486s. I think that despite what Apple has tried to accomplish with the Mac, trying to make it the appliance computer, it turns out the PC has become the real appliance computer. This is because people are buying them for all sorts of reasons, equating "PC" with "computer" and everything else is something weird and non-standard. I don't think the PC should be the appliance computer, because from everything I've seen it's a pretty ricketty and hard to use "appliance." I think what makes it an appliance is their price range, the userbase (obviously), and the amount of software available for them.

I submitted an article to Current Notes a little while back on just this subject: We need to face the fact that the majority of people using computers today are computer users. They look for what they

want to do with one first (the software) and they generally look by name brand (Wordperfect, Microsoft, Lotus), then they look for the hardware to run that software on. It's that simple. Even though we think of the name brand products as inferior to what is truly possible in an application, the majority doesn't know about it. Atari needs to get name brands to go to the Falcon, or Atari software needs to become name-brand-compatible in a big way. I also talk about another major point, DOS-compatibility, but I won't spoil it all for you guys. :-) Hopefully my article will be published by CN in the near future. As far as I know Joe Waters liked it...

I couldn't believe this equating "PC" with "computer" at first, until I told a friend of mine with a Mac that I had a computer. He immediately got all excited and said, "You've got to try this game, it is so cool!" He showed me this box containing the game Starflight from Electronic Arts. I thought he knew what computer I had since when I talked to him before I was always advocating Atari. He noticed me being a bit uneasy when he said that it wouldn't run on his Mac, since it was a PC game. I said, "Uh...I have an Atari 8-bit." He said, "Oh, okay. I didn't know." And he put the game away. Notice that I only told him I had "a computer" and he immediately thought I had a PC. He probably figured I didn't have a Mac, so a PC was the only alternative or something. He wasn't the kind of guy who would call his Mac a "non-computer." This was probably a bad example, but this has happened to me more than once with PC users, though.

> the TT was souped up in a very nifty way. :)

You're making an assumption that the RAM actually completes a cycle each 16 MHz clock, which is rather unlikely. Assuming 80 nS DRAM, the best DRAM cycle is around 150 nS or so, thus the memory is probably actually running basic cycles at 4 MHz for 1/4 of the rate you calculated.

If the the memory design uses Page Mode accesses they you might double this perfromance, and VRAM would allow what you suggested or better, but I don't recall having heard that the TT used VRAM.

You may also want to keep in mind that the processsor takes multiple clocks per memory cycle. A 68030 would take at a minimum 3 clocks per cycle, but might well run 4 clock cycles depending on the system design. Putting in a 32 MHz processor in a "16 MHz system" might yield 5-8 clock cycles, again depending on the design, with faster operation coming from the speed-up on cached operands and internal cycles such as multiplies.

There was nothing quite like a marathon program typing session, followed by a long CSAVE to some overpriced BASF tape. Why, back in the good old days, we didn't have expensive software to write your checks and pro-cess your words in five fonts. We had budget makers in BASIC and AtariWriter and Letter Perfect. SCHwahhh schwahhhh schwaaahh!

We weren't paid and we didn't get laid (well, I was only 12 at the time...) and that's the way we liked it. We get hot when we got 1200 baud modems and all our compatriots were still at 300 baud. Our big goal in life was to write assembler programs that turned into over 4K of binary.

Then the IBM PC came along and ruined everything for us hobbyist programmers. Programming became irreversibly professionalized and computer manuals got expensive. Even companies like Atari, which rely on hobbyists, started exacting oppressive tariffs on midnight engineers and part time programmers in the form of "developer's fees."

What a downer!

I visited Silica Shop/Systems on Tottenham Court Road on Friday, hoping to finally get my paws on a Falcon as they've been advertising 'The Falcon Has Landed!' for a month or so now.

Surprise, surprise, no Falcons.

On approaching one of the spotty assistants I was told that the hard drive versions would be arriving 'at the end of November' - it was the 27th and the bog-standard ones would be arriving in March !!!

Come on, can someone please tell me this isn't true. Preferably some marketing twonk from Atari who should be doing his/her job properly.

Mark Ripley

Source record: 214150

My impression from the lawsuits between Apple and Digital Research
was that the subsequent versions of GEM required "tiled" windows
as opposed to "overlapping" windows..

That is, the "new" versions of GEM look like the DOSSHELL available
with MS-DOS.. two windows adjacent to each other, but not overlapping
as we're used to seeing with GEM, or like the Macintosh desktop.

The Atari version of GEM was "grandfathered" under the previous license,
but any new versions had to follow the lawsuit settlement..

>hear anyones opinions based on their experience from playing these
>games. Thank you!

Since these games are quite old I guess you'll be able to buy them at a
knock down price. Carrier Command has nice smooth and fast graphics but the
gameplay is crap. The enemy carrier cheats, it's planes are indestructable
it has no amphibious vehicles because it can go on land itself.

I don't have Gunship but a friend of mind does and I'd say it's a fairly
decent game with adequate graphics and authentic gameplay although I never
played it much.

6207. Re: Atari seen in Compuke! Magazine

Newsgroup: comp.sys.atari.st
Date: 1992-12-01 09:51:03 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <70638@cup.portal.com>
Source record: 213954

Mark Miller wrote about magazines, Compute! in particular,
and their support of the Atari market..

A predominently popular notion seems to be that magazine
publishers don't need to eat like the rest of us..

Somehow, they're supposed to be able to go on tilting at
windmills, while at the same time putting food on their tables
to feed their children.

Sorry folks, that's just not true..

Anyone remember "Compute II, the Single Board Computer Magazine"
???????

I was truely disappointed when they stopped supporting the
single board computer market, which included the Ohio Scientific
Instruments Superboard II.. a computer I thought was the very
BEST design I'd seen..

The company (OSI) had produced a computer which overshadowed the
other participants in the market at that time: Apple I, TRS-80,
Commodore PET... BUT.. the company didn't know how the hell
to MARKET the amazing computer they'd produced..

The result was that the OSI computers faded away from the market.

And.. the magazines which had supported this aborted child of
the computer revolution turned to other platforms so that they
could continue to sell issues and pay their bills..

Compute! is no different.. if no one but a tiny "hardcore"
audience buys their magazines, then it's in their own best
interests to dump the stragglers and go with a mainstream
that WILL buy their magazines.

Why is that so hard to understand..?

Look at all the "Atari specific" magazines that have either
completely folded, or have reduced their publication schedules..

Do you want them to continue to print and mail a product that
no one is willing to pay for, out of the goodness of their
hearts..? What wonderful sacrifices you want them to
take on.. and why..?

Why not look to the REAL cause of all the problems in the
Atari market..?

You're probably right, but Fido is a lot busier in the Atari field than
Usenet is. It may be worth considering gating it into c.s.a.st :)

Besides, the existing znet gateway is bringing in Fido, so it makes
sense to move it as well.

> As far as the online-magazines go, would the envisaged traffic be

> c.s.a.st? IMHO, if we're going to go through the RFD/CFV route, we
> ought to be doing so to create comp.sys.atari.falcon, although I
> suppose that that combined with comp.sys.atari.online_mags would be
> my preference.

You have a valid point, though feedback so far indicates a preference
for the mags in separate groups. Bear in mind that online mags like
Toxic Custard and the EFF groups have their own groups, yet are only
posted to once per week.

Posting them to separate groups allow them to be given long expiry times
compared with normal postings on all sites.
(eg: I would set them to a 12 month expiry minimum, and my MS-DOS
platform doesn't handle the Expires: header)

Also, it would mean that people don't have to wade through masses of
general postings to read the mags.

> To clarify, my suggestions are to RFD/CFV comp.sys.atari.falcon to lower
> the current traffic and then post the online mags to comp.sys.atari.st.

Is there sufficient interest in the falcon to justify the creation of a
separate newsgroup for it?

How about sending comments to my atari mailbox (atari@dogbox.acme.gen.nz)
and I'll summarise the opinion on this when I report back on opinions
regarding the magazine newsgroups.

I will attempt to acknowledge all mail, and will list posters when I
summarise.
(A couple of acks. have bounced so far - ensure your address
is valid please...:)

Bear in mind that any official discussions/voting/group creation will
have to wait until January. I am simply gauging opinion to see whether
it is worth doing it.

> >Alternatively, if there is insufficient interest in doing this, I propose
> >creation of an alt.sys.atari.* area.
>
> Why would these do any better that alt.znet.* ?

Because currently alt.znet.* is crippled. There were several hundred
messages sent out to the net without a proper newgroup message,
and consequently a lot of administrators aliased it to /dev/null
so that it wouldn't clog up their junk spools.

I bought a German version of MW II quite a while ago and I'm really
disappointed. It's a good game but the copy protection drives you mad.
It allows you only to play from floppy disk. And it loads very often! I think
it also doesn't realize any RAM size above 512 KB.
If you can't get a (newer?) version without this stupid protection, don't
buy it!
I also would be very happy if somebody could tell me a way to install it
on hard disk or ram disk.

6215. GCC 2.3.1 and GDB

Newsgroup: comp.sys.atari.st
Date: 1992-12-01 13:28:19 UTC
From: csucf@csv.warwick.ac.uk
Message-ID: <1ffp9jINNhdv@lily.csv.warwick.ac.uk>
Source record: 213966

I've been using GCC for a while now and finally got around to trying the debugger (GDB) so I downloaded it from Atari.archive recently and gave it a bash...

That was when I hit upon a problem; I can use it perfectly if I don't need the symbol table!! I have tried all of the debugging options from gcc (IE: all of the -g options) but whenever I try to load the symbol table from within GDB(using symbol "filename") I get the filename followed by:
"is not in executable form"
The one clue I have got is that there is a program file called sym-ld.ttp in amongst the other executables for gcc, so I tried replacing gcc-ld.ttp with this, and I got a symbol table but no executable program..

What I want to know is, am I missing an environment variable that should point to this executable so that gcc knows how to produce a symbol table or am I doing something else wrong?

Any help would be most appreciated...

Please don't reply to this login if possible, a friend of mine is posting this for me...
Reply to grw@ukc.ac.uk or just post a reply, I read the news just about every day

Thanks in advance...

This is most probably a problem in the power supply. Due to aging
and drifting of components, the +5V line drops below a threshold,
and the drive won't start. For some power supplies, there is even
a hardware hack to fix this, but I'm not experienced enough in that
to give you details on this.

>Erlend.
>

I constantly find myself wishing people wouldn't use Lharc - it is just so unstable and nonstandard.
The unstability of the ST versions can probably be attributed to GFA Basic - the version of LHarc I have CRASHES if you try to unarchive something compressed with a later compression standard and is incompatable (ie CRASHES) with half of the AUTO folder stuff I use (which is funny because I have never had any problems with anything else.). The self extracting version (which I assume is assembly coded) fails to do any error checking whatsoever (eg disk full etc) and also randomly CRASHES (run it again and it's OK usually).
However, even the UNIX version at this university (Which, being non-standard is only available on some machines - ZOO is available on all) CRASHES and dumps the core whenever anything goes wrong (Eg. wrong archive format - the version we have doesn't support later compression standards).

What is the matter with ZOO? It has been around for years, is available for every machine under the sun (And installed on most) and is utterly relyable. If you try to decompress a file which uses a new format it says that you need a newer version. The zoo-high compression is just as good as LHarc anyway.

If it were up to me I'd ban use of .LZH on archive sites.

- Leo

6219. Re: znet magazine in the comp.sys.atari heirarchy? PLEASE READ

Haven't we seen all of this before? Once again, I think that this is
a bad idea, when the magazines are readily available from
archive sites and Greg's mailing list. There's no real need for
people to be posting 50K+ magazines to a newsgroup that will hit
every machine in the civilised part of the planet (and it'll probably
make it to the machines in Minnesota too :)), when anyone can
get them in one of the other methods.

Digging out the flame thrower, as I'm sure to hear more about this,

I had the same reaction to this you did, Bob. Any goodwill that kept
this ever-shrinking community together is now long-gone, I'm afraid.

>How long until the "good riddance.. we didn't need Double Click
>anyway" messages..?

Well, ah, er...

>Does anyone else get an uneasy feeling in the pits of their stomachs
>about one of the premier software producers for the Atari line finally
>surrendering to the pressures of day-to-day reality...?

Anyone who can't see the "Abandon all hope, ye who enter here" sign
hanging above their ST's *now* needs to have their head examined. I
suppose if it takes more than this for people to realize how bad things
have gotten Atari will just have to file for Chapter 11. I suspect
that at that point some people will still be bewildered at why no one
develops for their favorite machine anymore.

Hard facts of life:

1. The quality of a machine has nothing to do with its success
in the marketplace.
2. Developers can only make money writing for machines with
installed user bases (i.e., people who actually pay for
software) larger than the number of employees they have
working for them.
3. Unfortunately developers need to eat, which implies that
they need to make money.
4. You can buy a PC that runs several orders of magnitude
more software, can be upgraded forever, has better graphics
and sound than the ST, and is considerably faster for about
$900 now.

This latest event is just symbolic, really. It's been this bad since
late summer, when it became obvious that there would be no Falcons in
stores for Christmas, and when the idiots at Atari headquarters in
Sunnyvale tried to tell me that companies like EA would actually write
games for their latest hunk of outdated hardware when all they planned
to provide with the box in the way of a development system was GCC.

(Oh sure, we'll be glad to put 10 of our $50,000 a year in-house programers to work on your new machine. I'm sure *millions* of people will just snap them up Any Day Now, and we'd much rather risk a half a million dollars on your machine than invest the money in a guaranteed 100,000 unit-sales project for the Nintendo.) NOT.

Congratulations, Jack. You've taken a Fortune 500 company that used to have 95% market share and given it to your incompetent kids as a plaything, and now they've broken it. Why don't you just dissolve the darn thing and give the money to charity instead of frittering it *all* away?

>Let's see what we can get from them for free..

Anybody wanna buy an ST? :(

Just wanted to vent some frustration myself. Also, I thought maybe someone knows
something I don't. I bought my TT with the intention in mind that Unix ASV
would be available from Atari. I picked a very nice color brochure on the TT
back in the Fall of '90, (had my TT since May '91 waited 5 months for it) which
spouted that the TT would have Atari's System 5, rel. 4 Unix would run on the TT.
I've heard that the TT as well as the Amiga 3000 is too slow to run Unix with X.
Well, all I have to say is, look at the Sun 3/50 (68020 at 16Mhz) and Sun 3/60
(68020 at 20Mhz) running Unix adequately. I don't think any of them had X, but
for crying out loud, they ran Sunview. These Sun's were about all we used here
at work in the distant past. So, yes I am a customer for ASV on the TT,
and yes I don't want to spend $2500 plus. At least make it available (or at least
RSN) as a student version with just shell capabilities. Then, people will probably
come up with a GUI somehow.

CUL,
Chuck

Congratulations, because you'll really need to do so if you want to run anything using MS Windows - opposed to us unfortunate guys that have been using GEM on un-expandable ST's for about 6-7 years now. And because the ST wasn't crippled with a 8-bit bus-system limiting both disk and graphics performance, I just boot with a software graphics accelerator and suddenly GEM is faster to work with than my friends very expandable 80386 using MS Windows.

>ALL the peripheral cards just pop back into their slots, the

Admittet, it easier that way. But you tend to forget that the average PC user is not capable of handling the DIP-switch nightmare that seems to follow some upgrades, and thus, he or she must go to a dealer anyway...

>
>BobR

Yes, you can upgrade your PC if you can afford it. But it is the same story all over again. It is cheaper to buy as much as you can afford in one go, and it is more expensive to build your system along the way! I know my total cost for a usable WIMP system is far less than compared to those that bought a 10MHz XT, upgraded it to a AT-like box and now are facing the challenge of buying a 386 or 486; even though the ST was a little more expensive than the XT back in 1986 (and naturally I've been enjoying the WIMP environment during all the years).

In fact the most expandable system I can think of would be an empty box,
you could put almost anything inside it; but I tend to like the Atari
approach a little better, i.e. put as much functionality as possible
on the main-board (albeit this is no reason for not putting a VME bus
on the board as well, are you listening in Sunnyvale? :-)

Riddle me this;

It flys without feathers into a tree without leaves, who ate it?

This is a riddle from the game amberstar which originates in germany. One
can't help but wonder if something has been lost in the translation from german
to english or if this riddle requires a german culture. I don't know anyone
local in Calif. USA who knows the answer. So maybe someone nonlocal??

Thanks for any help,
John

I had a discussion with the boys at BMS a while back that might relate to this.
Various drives use different parts of the ranges allowed in the SCSI spec.
(which wasn't really standardized until a lot of things were on the market).
In particular, I believe Maxtor drives want all the message passing to be
done at the fast end of the allowed range, while Syquest drives like the slow
end. And host adaptors tend to need a little tweaking to catch the corners
of the range. I was asking in particular about how practical it would be to
combine an ST296, a Wren V and a Syquest. I may be a little confused, but
the way I remember it was that they told me it would take more luck than one
could count on, because the ST296 hit both fast and slow extremes, the Wren
was uniformly fast and the Syquest was uniformly slow.

>magazine it came with cannot be order as a back
>issue as they are all sold out.
>If anyone could supply me with a copy I would of
>course be willingto pay for the cost of the disc
>and all postage fees incurred.

Just a quick note to those of you out there who may respond to Mr. Lewis's request:

The main cover program of magazines such as ST FORMAT and ST REVIEW are generally commercial programs. (They may not be the =latest= version.) As such, they are not shareware/freeware/public domain. Copyright and software licensing rules still apply; the person who purchases the magazine is considered to have "purchased" the software package as well.

It would not be legal to provide a copy of your January 1992 ST FORMAT cover disk (the one with the Sequencer One program which Mr. Lewis wants). It should, however, be legal to sell your copy of the January 1992 ST FORMAT magazine issue along with the original cover disks for that issue. Of course, you would then have to erase any copies of the Sequencer One program which you still have in your possession.

LHarc 2.01? Is programmed in optimised assembler. Not GFA-Basic!! Where did you get that odd idea?

Using v2.01L - it has never ONCE crashed. (Except when I tried running it with about 30k of RAM available).

It is quite a bit faster than ZOO, and gets slightly better compression. (Only very slightly). But it *is* faster. And LHarc has a lot more options!
(It also works properly from GEM!) ZOO isn't really of much use without UNIX to redirect the output. (Or using tos 2.?? or higher - or Teradesk etc.)

Stick to what you like, and make sure you always have the latest version!

I can extract ARJ, ZIP, ZOO, LZH, ARC, Z. Files happily - and the respective programs are all in the same folder, and are run with the click of a button! (Automatically extracting to wherever I want them to using Teradesk's output to window directory option!)

All this proves is that Windows is a slow piece of crap. You don't
want a slow piece of crap? Then don't use Windows! Use OS/2 or one of
the other GUI's for the PC. Use GEM if you really want to -- it runs
on PC's. Or run X under 386 MACH for pete's sake. X is a lot faster
on a $200 386DX than GEM is on an ST, that's for sure.

>>ALL the peripheral cards just pop back into their slots, the

Come on. Computer-illiterates will *always* need hand-holding.
They're certainly not going to have an easier time trying to solder in
their ST "upgrade." Instaling most PC cards is just a matter of
sticking them in the slot and choosing an IRQ (usually with software,
and the default usually works just fine).

>>If an Atari owner CAN'T afford a TT or Falcon, he CAN'T upgrade
>>his computer (other than the "hack and slash" method).

As if Bob really needs to point this out. Come on -- there's NO
argument that favors a closed architecture computer. We've been
through this all before, and the only reasons I've ever heard why
people like closed architectures are totally religious. (I.e., some
people just can't stand to own a mainstream computer.)

>Yes, you can upgrade your PC if you can afford it. But it is the same
>story all over again. It is cheaper to buy as much as you can afford
>in one go, and it is more expensive to build your system along the way!

This isn't so true anymore. Yes, the cheapest way to go from nothing
to a 486 system now is to buy a package from one of the mail order
places like Gateway. But at the moment I can upgrade my existing
system to the next generation of processor for just the cost of the
motherboard (or, if I choose to go to a clock-doubled 66DX-2, the cost
of the chip itself).

In contrast, NO PART of my existing ST is useful now in terms of
upgrades. I can't get any value for it when I upgrade. If I buy a
Falcon (ha-ha, that's a good one), I pay the price for the whole
machine: floppy drives, power supply, ports, keyboard, etc. -- things I
already have in my ST.

>I know my total cost for a usable WIMP system is far less than compared
>to those that bought a 10MHz XT, upgraded it to a AT-like box and now are
>facing the challenge of buying a 386 or 486; even though the ST was a

Historically speaking you may be right, but now the prices are totally
against you, especially in the US. PC prices are insanely low now --
you can get complete, new 286 systems (with VGA monitor, keyabord, 80
meg HD, etc.) for $500 now. 486-50 motherboards are less than $1000!
And don't think for a second that a 16Mhz 68030 is going to outperform
a 50Mhz 486, Intel brain-damage notwithstanding.

>i.e. put as much functionality as possible on the main-board (albeit

Here's my vote to RFD a c.s.a.falcon group also... heck an RFD cannot hurt
can it, and it will start the 'process' to be in place when it may most be
needed.
Also, on the mags issue, I would like to see a c.s.a.mags group but am
also hesitant on the size of them and the load they will incur (if this is at
all significant really). It would be more convenient than FTP'ing the mags
and would save the trouble of of 'overflowing' people mailboxes.
I'd even like to see the hiearchy split further although I know this has
been looked on unfavorably in the past.
Just my 2 centavos....

I agree that my question about the DC stuff becoming available at
a.a sounded kinda greedy, but I don't see at all why it should
contradict any goodwill spirit. What made me post ist that I've
read about DC-xyz here in this group fairly frequently, but never
had a chance to look at the stuff. I figured that, now that it's
being released into the public domain, this may be a good chance
for me and for others like me to check out the DC software.
Anyway, I have yet to understand what inquiring for some piece of
newly released PD software has to do with lack of good will.

>>Does anyone else get an uneasy feeling in the pits of their stomachs

>have gotten Atari will just have to file for Chapter 11. I suspect
>that at that point some people will still be bewildered at why no one
>develops for their favorite machine anymore.

I really wonder whether it's necessary to see things from such a
pessimistic point of view. Of course, all those small computer
systems, i.e. Macintrash, PC, Amiga and Atari will become kinda
obsolete once those real unix boxes become affordable to many
people. But until then, it's equally good to have an Atari than
to have any of those other systems, to say the least.
If you want your computer to run so-called "standard" software,
then you're doomed if you have an Atari. But then, that's not
everything one can do with a computer. I for my part would
consider myself doomed if I had to program under MSDOS, AmigaDOS,
or the Mac OS (horrors). Therefore, I'll stick with Atari until I
can afford some real neat Unix box. Not because I'm a lunatic,
not because I think Atari is the best, but because Atari is the

best I can afford right now.
I figure there's some more folks out there who see things the way I do, and this is what will keep Atari alive for some time. And as for the long run, nobody knows what will happen to microcomputers in two or three years, but I argue that Atari's chances may be quite good in the long run, because Atari definitely has the best selection of non-commercial software among all microcomputer platforms. And I'm quite sure that the software of the future will not be copyrighted for the profit of software house owners (who are the real vultures of today), but rather be distributed under copyleft, protecting users and programmers instead of software houses.

The Video-ram in the TT is actually 100ns! The maximum transfer from this RAM
is done when 1280*960, 1 bitplane at 72Hz is displayed. The video have access
to ram in 50/50 timesharing with the CPU. The CPU accesses ram through
a 32 bit bus and the video through a 64 bit bus. This should indicate
that it is capable of transfering 10.5 MBytes/s (1280*960*72/8 Byte/s) from
the 64 bit bus, plus approx half that figure from 32 bit bus (CPU)!

>If the the memory design uses Page Mode accesses they you might double
>this perfromance, and VRAM would allow what you suggested or better, but
>I don't recall having heard that the TT used VRAM.

It don't!
And I agree that his figures was way to high!

>You may also want to keep in mind that the processsor takes multiple
>clocks per memory cycle. A 68030 would take at a minimum 3 clocks per
>cycle, but might well run 4 clock cycles depending on the system design.
>Putting in a 32 MHz processor in a "16 MHz system" might yield 5-8 clock
>cycles, again depending on the design, with faster operation coming from
>the speed-up on cached operands and internal cycles such as multiplies.

You're a bit wrong here. Best case burstfilling gives a performance of
4 longword access' in 5 cycles! Synchronous (longword) access is done in
2 clock cycles. (Information from MC 68030 User's Manual)

I uploaded it to GEnie. It plays 8 bit mono WAVE files.
The resampling algorithm is pretty slow, but I have made
a big improvement. I will upload the new version in a week
or so. It will play 8 and 16 bit mono and stereo WAVE files

Yes ZOO is good if you are a UNIX freek, does not work to well on a single drive ST....

LZH201x will extract to any drive and also creat a folder on demand, this is some of the things that ZOO can't do...

ON the same line, does anyone know of a hack to get it to run
without the dongle? I have both LB Golf and Tenth Frame, both which use
the dongle. (And of course I lost it a while ago!!) I have been using a
Colecovision joystick as the dongle, just hold down 0 on the keypad
while the game boots up, but it is still a pain. (I guess I could easily
make a new dongle, I've got some old joystick cables around here
somewhere, but that's too much work!!!)

6243. fsck for minixfs under MiNT?

Newsgroup: comp.sys.atari.st
Date: 1992-12-01 21:58:38 UTC
From: root@troja.IN-Berlin.DE
Message-ID: <0010.12.92@troja.IN-Berlin.DE>
Source record: 214051
Cross-posted to: de.comp.sys.st,comp.sys.atari.st

Hello,

I recently discovered some problems on my GNU development filesystem.
Since I only use this HD-partition under MiNT and I did some ports of
*IX software, I organized this partition as a minix filesystem.

The problems I ran into, seemed to be something equivalent to lost, or
multiple used clusters on a TOS filesystem. I'd be vary glad, if someone
would tell me, that I can find a `fsck' to repair minix filesystems
under MiNT.

The worst case is, when I'm told to program a fsck by myself :-)

any help would be appreciated
stefan

to avoid wasting of net bandwidth, please answer via email. If more than
one or two of you are interested in the results of this request, I'll
post a summary of the answers.

> It was reported in ST Format that the Falcon runs between 30 and 35
> MIPS.

Sounds to me like somebody lost the decimal point. A 16 Mhz 68030
with a 32 bit bus should run about 3.0 -> 3.5 mips depending upon
whether or not the memory is syncronous or asyncronous. With the
claimed 16 bit bus I'd expect 2.0 -> 3.0 mips, depending upon memory.

You make it sound so easy, but there's a lot more to it than this. You may be right in that they're unwilling to look at new stuff, but that's the way it is, and being right doesn't help one bit!

I find it difficult to recommend the ST to people who ask me what sort of computer they should buy *for general use*. The advances in hardware made by the PC clones and Macs, but most importantly of all the *software available* mean that I have to recommend PC or Mac (Macs for DTP, PCs for WP, Databases, Spreadsheets).

Why? The software is good -- look at Excel under Windows, or Ami Pro. Pagemaker 4.x on the Mac is knock-out. And they can get a good deal on a machine -- 386DX PCs with 4MB RAM and 80MB hard discs are cheap these days. But most importantly of all, there is a huge amount of expertise both locally (suppliers, training, other users etc.) and nationally (more suppliers, magazines, user groups etc.) And that support is going to be around for a long while yet -- I simply cannot say the same for any the ST.

Please don't reply to this article saying "but X for the ST is much better than Y for machine Z". To ordinary people, the other advantages far outweigh the fact that one application might be better on the ST.

Source record: 214010
Cross-posted to: de.comp.sys.st,de.comp.tex,comp.sys.atari.st

I wonder if someone has already compiled the program "bibclean" on the ST.

The program does some error checking and prettyprinting on bib-files
and was recently upgraded (-> comp.text.tex).

I can't run gcc/g++ effectively due to lack of memory (only two Megs :-(
so I ask if someone did this already and could kindly supply it to the
net.

The sources are available on ftp.math.utah.edu:/pub/tex/bib as
bibclean-2.05.[zip,zoo,tar.Z]

Thanks,
Thomas.

: editor, and if so, any details. I will then report back here.
:
: If any tracker programmers are watching, mail me! Cheers!
:

You might consider asking this question WHEN people have falcons and/or it's possible to say if there will be enough falcon users to make it worth the trouble.

Don't know Doc Satan, but Anders Nilson is currently doing his military service and won't be around for a year or so.

Unit-17 from sweden have a very interesting project going that they might consider porting across to the falcon, but again they will need to get actual hardware to be able to do/say anything of course.

You're a bit early I guess :)

Well, at a computer show I picked up a HD drive that was removed from a Zenith for ten dollars. (They didn't know if it worked or not.) I brought it home, plugged it into my ST and it worked fine as a 720k drive. (Although it didn't recognize media change, which got to be a pain.) I did have to flip the drive cable upside down so it was connected correctly.

Maybe there is just a jumper you need to switch somewhere?

>I agree that my question about the DC stuff becoming available at
>a.a sounded kinda greedy, but I don't see at all why it should
>contradict any goodwill spirit.

It wasn't that your post was about when the "new" PD software would be posted; the worrisome part was that that was ALL it was about. No "gee that's too bad" or "what a shame for the programers that spent 5 years of their lives writing software which is now worthless" or anything like that.

I wasn't pesronally trying to single you out; the whole ST community is just terribly unsupportive now, at least when it comes to $$$. Do I need to remind people about how pitiful shareware returns are on the ST? Take Blox, for example, which has been on the cover of at least one ST disk glossy and has gotten 5 registrations (several of which I only got as a result of bitching once before).

Though I'm very grateful for any compensation I get at all, the point is that it's more of a hassle to release something now than it's worth. I get all these letters from people asking telling me they'll register if I make some custom changes to the software. I now wish I'd never put anything out as shareware; I really don't have time to write a letter a week for free anymore, and I don't like patently ignoring mail as it's not very social.

Blox may not be the greatest thing ever written, but it's not THAT bad! (For the curious, download it and see; it's on atari.archive.)

What I see is a desperate community that has just let its developers fall by the wayside, and is now alternately completely deluded (e.g., about the Falcon redefining the market or some such drivel), utterly whiney ("How come no one writes ST stuff anymore?"), or religiously fanatical ("Dammit I'll never buy one of those evil *mainstream* computers -- if Microsoft writes for it I don't want it."). It's just maddening to read this group sometimes these days, especially considering how GOOD it was a couple years ago.

Now that DC is defunct (though damned if anyone there told me they were going under), there is now a question of what to do with Game Workbench. Do I want 4+ years of my and Neil's work to go to sit on a shelf collecting dust, hidden from the rest of the world for all time? No. Do I want to give 4+ years of my life away to people who, instead of paying me for it, or (even) writing notes saying "gee I like your program," will call me at all hours asking for free technical support or custom modifications? No, again. What to do? You tell us;

we haven't decided yet.

Sorry if it all seems personal, but I just can't hide the fact that I'm very disappointed in the way the Atari market has gone -- both commericial and otherwise -- and it really bugs me to see people *still* grubbing for free software without so much as a "nice job" to the programmers. (Again, not singling you out, Jan.)

Frankly, I place most of the blame on Jack's brats for being so utterly ignorant technically, and for being completely naive on marketing issues. Perhaps you need to meet with them in person to get a complete understanding of this.

And what kind of a jerk lets his kids run a Fortune 1000 company? Hello, anybody home? McFly, andbody home?!? Why wasn't some real management called in? Why wasn't the company reduced to a manageble size early on? It's just mind-boggling how badly run Atari has been ever since Bushnell left.

>I figured that, now that it's being released into the public domain,
>this may be a good chance for me and for others like me to check out
>the DC software.

Well I don't mean to hit too hard on this point, but by "check out" you of course mean "install on my hard drive and never pay a cent for it." Personally I think DC should have formatted all their masters and source code disks and said to hell with the whole thing. If the community won't support you when you're trying to survive by writing software, they certainly don't deserve to get the warez for free.

>If you want your computer to run so-called "standard" software,
>then you're doomed if you have an Atari. But then, that's not
>everything one can do with a computer.

One can program all day and all night with it, which is what you're going to have to do to have any good new software for the ST, Amiga, or any of the other minor platforms. At this point, no one's going to write a word processor. No one's going to implement a desktop video system. No one's going to write a good game authoring system. If you own a mainstream computer, you could actually buy new products like these. But if you refuse to move to the maintstream, you'll be forced to write all of it on your own.

This is exactly what some Atarians want. They'll be a close-knit, tiny community, just like the 8-bitters. But it's probably not what most people want, and it's sure not what any commercial developers want.

>I for my part would consider myself doomed if I had to program
>under MSDOS, AmigaDOS, or the Mac OS (horrors).

This is a religious argument. They're not that bad. From what I can tell the Amiga's a hell of a lot easier to program than the ST (at least for games). It's what the ST *should* have been. The others

have their own complexities, but plenty of people manage with them
and write really nice applications for them.

>but I argue that Atari's chances may be quite good in the long
>run, because Atari definitely has the best selection of
>non-commercial software among all microcomputer platforms.

Atari zealots always say this, but I really can't imagine how anyone
could come to that conclusion after having extensively explored the
free/shareware scene for PC's and Mac's. Sure, some pretty nifty
cheap/free software runs on the ST, but equivalent (and often better)
things run on PC's and Mac's. E.g.,:

ST PC

MiNT Minix, 386 mach (w/4.3 Unix emulator)
??? X (under mach)
Gulam 4-Dos
Gifshow, etc. Cshow, Graphics Workstation, etc.
Llamatron Commander Keen IV, Wolfenstein 3-D
arc, zoo, etc. All these and more
GCC djgcc
gnutils Gnuish project

>And I'm quite sure that the software of the future will not be
>copyrighted for the profit of software house owners (who are the real
>vultures of today),

Well, since you have that attitude, we'll just write our software
for markets in which people think software is worth paying for.

>but rather be distributed under copyleft, protecting users and
>programmers instead of software houses.

It's amazing to me how the FSF has brainwashed so many intelligent
people into thinking that, on a grand scale, this is 1) feasible and
2) good. Richard Stallman doesn't have to write software for a living;
other people support him. Since we don't live in a perfect Star Trek
socialist society, there will be plenty of people who don't have
companies giving them grant money to live off of and will instead be
focred to turn to actually trying to make a living off their trade.
Like people have been doing since the beginning of time.

Day-to-day reality didn't have anything to do with it.

Besides, with the loss of DC, we've also picked up Trace Technologies, founded by Keith Gerdes, one of the DC programmers. He's upgrading DataDiet and bringing out a new program, Data Rescue.

>I'll second "Yar's Revenge" and "Warlords" (haven't heard of "Adventure").
>And, I'll add "Pitfall" and "Pitfall II".

Lame games guys!

Actually, they were cool games, but there's plenty of similar games out
there. Yar's was just a shoot-em up. right? Warlords - dunno. Adventure
was a microscopic Moria/Nethack/Rogue/DungeonMaster.

What are some REAL classics (like Asteroids and Space Invaders - which have
already been done)?

The GDB docs explain all of this. You must run sym-ld.ttp by hand to produce
a symbol file that gdb can read. You will need both the executable program
that gcc-ld produced, and a pure-symbol file that sym-ld produced. I guess
the two files were kept separate on the Atari because otherwise the executable
gets too huge...

>mail me one? Thanks in advance!

crt0.o is part of the library. You can't use the compiler with just the
executable files, you must also grab the library and include files...

Is there anyone who can say truthfully "I have bought a Falcon" (other than people who got them through developer channels)?

Can anyone say truthfully "I have seen a Falcon offered for sale in a store"?

I would be very interested in hearing either of these statements. I have no interest at all in mail order places advertizing Falcons unless somebody has actually received a machine.

And while we're on the subject of Atari machines available outside North America, does anyone reading this have an ST Book which was bought other than through the developer program?

Port it to the DOS box. Maybe Windows, maybe OS/2, maybe just DOS. I would love to work on a project like that. A couple of times I've wanted to write a game creation system for the ST but with school and all never even started. But now that I have a 486 and good graphics, I'd like to write one for the DOS box. I can see it pulling in some nice cash.

If I saw something like the Game Workbench in a store, I might be sorely tempted to buy it. I never even got a glimpse of it. A friend of mine bought STOS, but I was only mildly impressed with that. I've shelled out money for quite a bit of ST software. It just sits there and collects dust now.

Sometimes I wish I hadn't spent so much time and effort on the ST. I have a better appreciation for a good machine (dontcha just love 16 general purpose registers, a flat memory model, no stupid artificial memory limits and no stupid memory classifications like upper, extended, expanded??) but I would have been farther ahead financially. And with tools like Borland C++ and others, development on the DOS box is now quite nice.

With the event of Atari Canada closing its' doors (this is true, it isn't just a rumour, right?) my STe seems even more obsolete. I was going to replace the broken hard drive, but why? I can get more back for my money by spending the money on the DOS box.

Cheer up Dave. Join the DOS and Mac world. They need more programmers like you.

As for the earlier comment about developing on the Mac, well, the Mac seems to be a nice system to develop for because it seems to have a relatively clean design and has been though out quite nicely.

John

Well, my two favorites are STAR*LINX in Phoenix Arizona at 602-464-4817
and ST-BASE (also in Phoenix) at 602-285-9246. Both have very active
message bases and file libraries (both are quite current). Both are run
on Atari's but support most computer types.

This is assuming that the system design supports a 1-clock (2-state) access mode. I doubt that the TT shared memory would, non-shared memory could but not neccessarily at the fastest possible speed.

On the Falcon, you would have trouble supporting the burst accesses, since the port width must be 32-bits...

For shareware/PD software to be kept by users, it must be cheaper, and better than everything else available. If there is a PD program, that will do the same, or better than a $50 commercial program. There is a fairly good chance that people will take the PD one! People these days are quite often writing garbage software, and then trying to charge amounts like $15 and over to 'register' it. This is fine if the software is *good* - but if other software does the same for less, that's the one that get's chosen.

DC-Format is one exception, it's the single best formatting program it's ever been my pleasure to use!

DC-Squish, PFX-Pack beats it for compression & speed.

DC-Desktop, Gemini, or Teradesk are pretty similar - and Shareware!

DC-Extract, just get ARC602, LHarc 2.01L, ZOO 2.14, and ZIP 2.0 and you've beaten all of it's features!

DC-Shower, is another original little program, that makes life a lot easier!

DC-Utilities (such as, Dc-Light off, DC-Mouse invert, DC-ometer) are pretty much all orignal. Many are of little use to the individual user, but they are a *GREAT* bunch of *free* utilities! (Although, you are encouraged to purchase other software from them if you like it - which is fair!)

DC-Data Diet. AFX *was* better than it, but is now also not supported.

Myself, I was going to purchase DC-Data diet, but several months ago there were rumours of Double Click shutting up shop - so rather than risk wasting my money, I waited for confirmation!

Programs such as Llamatron, pretty much original, great graphics & sound, and addictive gameplay. jeff minter made over 10,000 pounds from it! (Approx $15,000US). Which is a lot of cash for a shareware game! Which goes to prove, is something is *good* - people will get it!

It is a great pity DC-has disappeared, as they single-handedly produced some of the best mini-utilites the ST has seen. But with so many 100% commercial software producers going bust, or dropping the ST, it is going to be becoming more common to be seen, unless those useless prats at Atari get up, and sell their machines!! (And try to make sure they work properly before they hit the markets for a change!!)

The software industry is not a healthy business, except for the companies which put VERY, VERY good protection into their games!! Guess why!

As a side-question to this, does anyone out there have any clue if there is any demographic trend to the people who wn Ataris? I look at the (very valid) complaints like the above all the time and say to myself, "I'd give if i could! :(" But right now I'm 22 years old and trying to complete college. I don't have any money to give to anyone! Everyone's already laid their claim to my stash. But I digress... My wondering is if there are a slew of people my age (or there-abouts) ina similar situation as myself that "would if they could." When I finally get to the point where I HAVE a cash inflow that exceeds my outflow, I know I'll be upgrading my Atari ssytem just as I always have. Next will (probably) be a Falcon. Next round I'mm gonna go for a hard drive, and probably a Muliti-sync type monitor. (I've never even _seen_ high resolution on this damned thing!) And last-but-certainly-not-least finally register for all the Shareware I've been sharing for all these years!

It is pretty bizarre, mind-boggling, etc...how many CEO's Atari has gone through in its breif history. Atari actually showed up as a CASE Study in the

first chapter of my Principles of Management textbook where this point was illustrated. (This brings to mind another place where Atari DOESN'T show up -- the latest issue of Computer Shopper. No Atari column I could find -- lemme know if I just missed it...it is a BIG book:-)

> gnutils Gnuish project

I'm not very aquainted (beyond the necessaries associated with school/work) with the Intel, or Mac. But I do (big surprise:(have friends who arem none of them have anything good to say about Sharewarw/PD except that it's free. I havve a tough time convincing them that it's really a good thing. Would you say that maybe PC/Mac stuff _is_ a grade lower than ST stuff, or are they just distorted?

> was a microscopic Moria/Nethack/Rogue/DungeonMaster.

Disagree....Adventure had a completely different 'feel' than Moria OR DungeonMaster (Dunno about the others, but I assume they are similar to the two I know). Minor thing to argue about, but I'd hate for any of the games you mentioned turn out to be the reason Adventure isn't programmed by someone, it WAS different! 8-)

> What are some REAL classics (like Asteroids and Space Invaders - which have
> already been done)?
Those two game have truely been out-done. I have no fun playing them anymore. Well, okay, about as much fun as seeing Rambo XXI. Get my drift?

I'm gonna go FTP "Combat" from ATARI.ARCHIVE tonight, just to spite you! :)

So what did everyone choose instead of Blox? Really, I'm dying to know. If you want to tell me it's complete shit, do so -- I really don't have much emotional energy invested in it anymore. I'm genuinely curious to know what the problem is. The *look* of the game is certainly better, IMHO, than Llamatron, and I can say that with complete modesty since I didn't do the art. Llamatron looks a bit sloppy and ragged to me. (But still fast and frenetic, don't get me wrong.)

I think Unnkulian Unventure II is also competitive with similar commercial games in terms of quality and gameplay, but I hardly get any ST registrations for that, either. (It is interesting to note, however, that I've gotten more registrations from Denmark than from the entire United States.)

Because I feel that I can judge my own stuff at least somewhat objectively, and because my judgement is that, while they may not be God's gift to game players, they're certainly fun enough to warrant a $10 or $15 fee, I just don't buy the "no one registers your shareware because it's crap" argument.

Technically speaking, there are elments of Blox that are just as complex and speed-intensive as anything in Llamatron. (Take the full-screen spinning title page, for example. Compare also Blox's 11kHz samples to Llamatron's 5kHz samples. It's not easy to get a game running smoothly with a constant 11kHz drain on the CPU. Just because it doesn't gratuitously change the palette every vblank and put 100 12x12 sprites on the screen doesn't mean it's not doing anything hard. Just try writing an algorithm to generate the 5-hex pieces some time.)

In terms of polish, all I can say is that I spent nearly a full month tuning the game and polishing up the graphics and sound effects. Getting the samples right alone took about a week. (Though, sadly, almost no one's heard the stereo versions.)

It's easy to write things off when you don't know how much effort went into them. I'll never really know why Jeff Minter made 300 times as much money off his popular-arcade-game rip-off than I did with mine, but I don't think it's entirely a matter of software quality. I'm

really trying to be objective here. Flame away at will.

>DC-...

Awww, you never mentioned DC Snowball Fight. A program of the week.
Totally free. A gift, from me to you. Hundreds of hours of my time,
all for you. If I had asked for $10, would you have considered it
worth it? My recent taxi ride to the airport cost me $15. I have
a lot more fun beaning my friends with snow boulders than I do
getting driven through Boston traffic.

>Programs such as Llamatron, pretty much original, great graphics & sound,
>and addictive gameplay. jeff minter made over 10,000 pounds from it!
>(Approx $15,000US). Which is a lot of cash for a shareware game! Which
>goes to prove, is something is *good* - people will get it!

"Pretty much original?" Jeff may be a good hack man, but Llamatron is
about as original as HacMan! Much as I think Jeff's a great guy for
making the thing shareware, I really can't for the life of me fathom
why he's made so much money off it. I think that by your argument Blox
should have made at least $1000, since it is at least 1/15th as good as
Llamatron (give me *some* credit, sheesh). Since I have actually made
about $50 off Blox, your conclusion must not be right, unless Blox
is only 1/300th as good as Llamatron. (What would that even mean?
That it loads but you can only play for 3 seconds? :)

You've got your one shareware success story, and I've got my failures.
I don't know how to reconcile the conflicting data. But it's
definitely not as simple as you make it sound. Needless to say I'm not
rushing to write another shareware ST game.

YES, Microprose Golf is definitely recommended. The one thing that I do not like about it is that the courses are not models of real ones; I would quite like to be able to simulate hitting big divots out of St Andrews :-)

They've now done an endorsement deal, so it's now called David Leadbetter's Microprose Golf. I do not know how much the game has actually changed, though.

Microprose are in England, on +44 666 504326, I have no connection with them.

Obviously your brother doesn't have a hard disk, a Falcon or has seen the
improved PC version. Although MPG is a good ST game it is still another
example of Microprose saying "Who cares, that'll be enough for the ST
version".

Hi !
I have two questions :

1) Is it possible to redifine the characters on the Atari without
using GDOS or FSM GDOS ?
And if so can it be done from GFA Basic ?

also

2) Where can I get a PD copy of NEOCHROME from ?

ThanX,

Cross-posted to: misc.forsale,kw.forsale,uw.forsale,rec.music.synth,comp.sys.atari.st

I have an Atari ST system for sale. It is an Atari 520STfm that has
been upgraded to 1 meg. It has an internal drive and an external double
sided drive. It comes with a mouse and a high resolution monochrome monitor.
I'd like to get $450 for this system.
I am also selling an Atari 20 Mb hard disk. This drive works very
well and is pretty quiet. I would like $225 for this drive.
These prices are in Canadian dollars ($1US = $1.24CDN). The prices
are negotiable.

brett maraldo
519 742 0370

ps. I have a lot of software that is included with the system.

Come on Dave, don't get too excited. The reason Blox didn't bring you as much money as Llamatron did to Jeff could simply be that Llamatron has become something of a cult thing. Everybody has heard about it and so many people will check it out. Now I'm very sorry, but until you mentioned it I didn't know that you wrote Blox. I only knew there was a Lynx game called Blox. As a matter of fact, I didn't know you wrote games at all; the only thing which comes to my mind upon hearing your name is sound sampling. I can't speak for the whole net of course, but I see you as The Sample Man, as I see Minter as The Llamatron Man, and Eric Smith as The MiNT Man. Perhaps you should do more about marketing, but then again, I could just have skipped the announcement in nn and thus not have heard of it.

BTW, I still haven't played Llamatron yet - I downloaded it yesterday and it waits in my harddisk for room to get unpacked, as does Grav2. You know what? I'll ftp to a.a and see if I can find Blox there - If I like it you'll hear from me...

P.S. Please don't leave the ST community, as your postings were mostly quite interesting.

P.P.S. Do you know whether on other platforms the shareware principle functions better? (Just asking); Most PC owners I know have at least three or four times their systems worth in illegal software. Atari and Amiga have the bad reputation in this, but since a decent wordprocessor for a PC costs you about as much as the thing itself the total value if illegal software is much larger at the average PC user.

6274. ST overscan - a code

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 11:20:30 UTC
From: mapmh@gdr.bath.ac.uk
Message-ID: <1992Dec2.112030.4078@gdr.bath.ac.uk>
Source record: 214091
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Ok, well this is going to be the second posting of an overscan routine
and although most of the previous posting applies, this routine is
capable of a bit more.

For starters it is possible to extend the overscan even further to get
around 34 usable character display lines, this involves a second
critical switch between 50 and 60hz and then back again, near the top
of the screen.

Also, as it stands, this routine is pretty robust (I hope), it uses the
MFP timer B and there are 3 interupts during a screen scan, the first
happens near the top of the screen and does the switching business there,
the second happens about half way down the screen and here tell the
keyboard to shut up for a moment - this is to avoid annoying data loss
caused by the keyboard chip continuing to send data whilst interupts
are doing more important things. Also this middle interupt checks
that the 'scheme' of interupts are still in the same place, adjusting
if necessary. The third does the business at the bottom.

The checks to see when to do the switches read where the shifter is
currently reading from in memory and wait/go accordingly.

Note that you will need to allocate (I think) about 12032 extra bytes
of memory and as the routine stands you will also need to move the screen
physical address to a new (ie lower) location with this memory
available - I've left that up to you to do. You can do this 'legally',
wow! using the relevant bios routines if you use the code as it stands.

At it stands this routine has never hung on me, and I've tried silly
amounts of keyboard presses to try and mess it up without success. The
routine must be switched off if you access a disc though! I run it on
a 1MB STFM, but I haven't a clue if it works on the STE's, also I have
no idea what would happen if you used it in conjunction with a 60hz TV,
ie in the states - monitors should have no problem (I think).

To use it - you need to do the following:

call switit - this routine modifies the code slightly (oh dear what a
bad programming practice!) so that it will run in the
screen memory location given. I am not totally sure
that this routine will run with the screen address
anywhere, normally I put the screen on a 64k memory
boundary.
call startbig - This switches on the overscan routine
call killbig - this switches off the overscan routine

Note that if this routine does, for any reason, go wrong it will HANG
the machine, ie reset will be the only way out.

Feel free to email me with questions, queries, complaints, I'll try and
answer them if possible. Also let me know what machines it works on.

I have put some comments on the code - I hope they will help you to
understand what is going on.

Mark

email: mapmh@uk.ac.bath.gdr

Disclaimer: I wrote this code some time ago and never quite got around
to writing an optimal version, the processor overhead in this code is
slightly higher than necessary, but it is a real pain to work with.
(This is in case anyone wants to complain at me for my sloppy code)

Just try a program called msa141.prg (the number could be different 'cause it's
the version, I think). This program saves/loads a full disk in/from two files,
one with the tracks 0-41 and one with the tracks 42 to end...
the two files could then be compressed with lharc or whatever you prefer ...

Yesterday I found an advertisment:
ST-Computer 12/92 p. 107 (Data 4.0 professional)

This program uses GDOS-drivers. And it supports HPGL-plotters.
Don't ask me, if it is a GDOS-HPGL-driver.

If you've got the answer, please write to me.

I don't think the software is now worthless (would I be
interested in worthless software?), and I don't think the 5 years
that those programmers have spent working for DC are wasted time
for them. They have spent their time writing software which is
useful to many people, and they have made their living doing so.
Of course, the folding of their company will cause a lot of
problems for those folks, at least temporarily. But then, it
seems that one fo them has already started a company of his own,
so things may not be so bad after all. Anyway, I think it's a bit
far fetched to conclude from me not mentioning this that I am not
aware of this, or that I even enjoy seeing companies folding.

6284. Ghostscript- What is it?

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 13:28:06 UTC
From: "Gerry O'Rourke"
Message-ID: <1992Dec2.132806.10544@nt.com>
Source record: 214085

I am still looking for a way to print out GFA-draft files on a Postscipt laser printer. I have tried converting them to Meta files & have used Meta2ps, IMG2ps (which is the same as Meta2ps,even though IMG files are NOT metafiles), both of which fail to produce any output.

So far I have been able to import into Timeworks, but cannot preserve the dimensions of the original drawing.

I have been advised to try Ghostscript, but I cannot find a description of what it is or claims to do. The files on a.a are very large, & I don't want to FTP all of them just to find the doc's & then find out it's no use to me. Can somebody please post a short description of what Ghostscript actually is.

regards

Gerry O'Rourke

6285. poorly ST + FAQ revisited

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 14:05:28 UTC

Many thanks to everyone for their e-diagnoses of my poorly ST;
it was the power supply. "Everyone" (so far) =
Steve Jacobs, David P. Forrai, fgtbell, George Seto, Erlend Nagel,
John Willi Cummins, Christopher Hicks, Rick Venable, Paul Meekin
& (especially) Leo Hendry who physically checked the voltages etc.

A few people agreed that an FAQ section on common faults would be
valuable - would anyone more knowledgable than me be prepared to
initiate such a section?

-- Ewart Shaw

Irreverent thought: if MultiTOS is currently only available on disk,
maybe it should be renamed LoaderTOS.

Source record: 214093

There is a semi-decent version of tar in the MiNT distribution kit. It
is called with the standard...

tar cvf <tarfile> <filespec ...>

... to create tar files, and ...

tar xvf <tarfile> <filespec...>

... to extract them. These are the only two I've tried, but
there is no reason to believe that they are the only ones that work.

One thing it cannot manage is the 'z' key to pipe either input or
output stream through 'compress' to create a file.tar.Z file. This is
mainly due to it's TOS origins as opposed to MiNT.

The file tar.ttp is in the bin1 subset (read the docs), and since the
subsets are just zoo files, you ought to be able to ...

zoo x /usr/bin/tar.ttp

... to extract it.

The MiNT distribution kit is on a.a.u.e in the directory

/atari/Mint/Distrib_kit

Documentation is with the programs.

Simon.

>
>The "Atari Theme Song"...

But out of the "ruins" of DC has sprouted Trace Technologies, a company formed by Keith Gerdes (formerly co-partner of DC, now supporting Data Diet and releasing Data Rescue) and Advantage Software (owns the rights to Storm). Mike Vederman is now writing an assembly language programming column for Atari Advantage magazine, so he is still being active in the ST community.

The end of DC is more evolution than disintegration.

>>vultures of today),

>Well, since you have that attitude, we'll just write our software
>for markets in which people think software is worth paying for.

I never said software wasn't worth paying for. I have no problem
paying programmers for their work, but I definitely don't want to
pay software house owners, their lawywers, and all those other
crap folks who are out there making money at the expense of users
and programmers. If one buys some standard software, at a
ridiculously exaggerated price, most of the money he pays will go
to those vulture folks, not ot the programmers.

>>but rather be distributed under copyleft, protecting users and
>>programmers instead of software houses.

>It's amazing to me how the FSF has brainwashed so many intelligent
>people into thinking that, on a grand scale, this is 1) feasible and
>2) good.

The FSF hasn't brainwashed anyone, at least not as far as I know.
The people who want to do things the commercial way have much
more brainwashing power than the FSF. I don't understand what
advantages copyrighted software should have over copylefted
software. What good does all that sueing (sp?) and preventing
people from using concepts, ideas and algorithms to the community
of programmers and users? I am constantly amazed by the fact that
people who will do almost anything to minimize OS call and
multitasking overheads are willing to accept horrible and
superfluous overheads in a totally brain-damaged ditribution
system that may be "feasible", but no good at all.

Any RFD and CFV will have to wait until January - the moderator of
news.groups is on vacation.

> and would save the trouble of of 'overflowing' people mailboxes.

2 magazines. 50k per issue. approx 50 issues per year.

The fido echo would increase the total traffic by approx 650kb per week.

Allowing for 1 year expiry on the mags, and one month on the rest
we're looking at a total spool space of around 7Mb.
(These are the figures I use on my site)

I have 10 day expiry on the amiga newsgroups and they take up more
space than that........(20 comp groups, 5 alt) :)

Based on a 10 day expiry, you'd be looking at adding around 1Mb max to
the c.sys.Atari newsgroups, bringing them up to a total spool size of around
2.5-3Mb

Is this excessive?

Bear in mind that the znet groups already exist, they just don't
propagate well. This is intended to remedy that. It should lead
to a drop in mailserver and ftp traffic.
